sens® series LB 480

Limit Switch

Id. No. 54733-20BA2S
Rev. No: 03 02.2017
Embedded Soft. from Rev. 1.00.00
Device Description from Rev. 01
Dear customer

Thank you for purchasing the measuring system SENSseries LB 480 by BERTHOLD TECHNOLOGIES.

The scope of supply also includes this User’s Manual. Keep this User’s Manual on hand for reference at any time.

Please observe the warnings and safety instructions given in this User’s Manual to rule out personal injury and property damage. They are identified by the following symbols: DANGER, WARNING, CAUTION or IMPORTANT. In Volume 1, “Meaning of Other Symbols Used in this Documentation” you find an overview of the hazards to be observed and instructions on how to deal with these hazards.

Please read this User’s Manual prior to installation to get familiar with the product.

If you do encounter problems despite careful study of the User’s Manual, please do not hesitate to contact us.

Your BERTHOLD team

1. About this User’s Manual

1.1 Typographical Conventions

The symbols and typefaces used in this User’s Manual have the following meaning:

- prompts you to carry out an action.
- identifies items in a graphic.
- identifies enumerations.

*italic typeface* highlights important information.

*bold typeface* indicates commands or menu items.

*bold italic* identifies user entries.

The term BERTHOLD TECHNOLOGIES is used in this User’s Manual for the company BERTHOLD TECHNOLOGIES GmbH & Co. KG.

Please observe the warnings and safety instructions given in this User’s Manual to rule out personal injury and property damage. They are identified by the following symbols: DANGER, WARNING, CAUTION or IMPORTANT.

---

**DANGER**

Indicates a direct threat of danger. The consequences will be death or most severe personal injuries.

---

**WARNING**

Indicates a possibly dangerous situation. If the situation is not avoided, death or serious bodily injury could result.

---

**CAUTION**

Indicates a possibly dangerous situation. If the situation is not avoided, minor or moderate bodily injury could occur.

---

**NOTICE**

Indicates a situation which could result in material damage if the instructions are not observed.

---

**IMPORTANT**

*Paragraphs marked with this symbol provide important information on the product and on handling the product.*

---

**Tip**

Includes application tips and other helpful information.
1.2 Meaning of Other Symbols Used in this Documentation

Warning: Do not step or stand under a suspended load.

Warning: Radiation

Warning: Ex-protection

Warning: Risk of crushing

Requirement: Switch off power

Requirement: Wear a hardhat

Requirement: Wear safety shoes

1.3 Meaning of Warning Signs on Detectors and Source Shieldings

Warning: Radiation
This warning is located on the source shielding.

Warning: Please read the User’s Manual prior to installation
This warning is located on or in the terminal compartment of the detector.
1.4 Terms Used in this User’s Manual

CrystalSENS
Standard point detector version in the SENSseries LB 480.

UniSENS
Standard rod detector version in the SENSseries LB 480.

SuperSENS
Highly sensitive detector with large volume plastic scintillator 150 x 150 mm for large pipe or tank diameter.

TowerSENS
Rod detector with an especially large potential measuring length. In contrast to multi-detector configurations, only one detector is required here.

NaI detector
NaI = sodium iodide crystal = scintillator
Scintillation detectors are very sensitive probes for gamma radiation.

Isotope
Substance of the radiation source, e.g. Cobalt 60 (Co-60) or Cesium 137 (Cs-137).

Count rate
Value for the number of pulses standardized to one second.

Background
The count rate caused by the natural environmental radiation.

Cps
Unit for the count rate: Counts per second.

Factory setting
In the factory setting, all parameters are preset with default values. In most cases, this makes calibration of the detector a lot easier. Nevertheless, a calibration must always be carried out.

mSv
Milli-Sievert: The unit indicates the dose rate (dose equivalent).

mrem
Milli-rem (roentgen equivalent in man): traditional unit for the dose rate (100 mrem = 1 mSv).

MBq
Mega Becquerel: The unit indicates the activity of a source. Each Bq corresponds to one disintegration per second, i.e. 1 MBq equals one million disintegrations.

mCi
Milli-Curie: Traditional unit for the activity of a source (1 mCi = 37 MBq).

ATEX
Atmosphère explosive: is used as a generic term for the ATEX Product Directive 94/9/EC and the ATEX Workplace Directive 1999/92/EC. The directives contain provisions for equipment and components for use in explosion hazardous areas.

FM
Factory Mutual: an American industrial property insurance company that, among other things, issues certifications in the field of explosion protection.
1.5 General Information

The most important safety measures are summarized in this volume. It supplements the appropriate provisions which the staff in charge is obliged to follow.

Please pay attention to:

- the national safety and accident prevention regulations
- the national assembly and installation directions (for example, EN 60079)
- the generally accepted engineering rules
- the information on transport, assembly, operation, service, maintenance in this User’s Manual
- the safety instructions and information in this User’s Manual and the enclosed technical drawings and wiring diagrams
- the parameters, limit values and the information on operating and ambient conditions on the type labels and in the data sheets
- the labels on the device

Depending on the field of application, the corresponding chapters have to be taken into account.
Proper Use

The measuring system SENSseries LB 480 is a detector which, depending on its design, can be used for different measurement tasks:

- Level measurement
- Limit monitoring
- Density measurement

The measurement system is designed for the continuous monitoring and detection of levels and limit levels of liquids and bulk solids in bins, or to determine the density of liquids in tanks and pipes. The proper use is defined in the project planning stage by BERTHOLD TECHNOLOGIES, the system delivered may be used only for this purpose.

*If the detector is used in a way which is not provided for during the project planning stage and which is not described in the User’s Manual, then the detector's protection is compromised and the guarantee claim becomes invalid.*

BERTHOLD TECHNOLOGIES only accepts liability for / guarantees the correspondence of the systems of the SENSseries LB 480 to its published specifications. The detectors of the SENSseries may only be installed in an undamaged, dry and clean condition. Alterations and modifications to the system components are not allowed. Repairs to the detector may only be made if expressly authorized by the operating manual.

**Conformity to standards**

The standards and guidelines the SENSseries complies with are itemized in the CE conformity declaration.
Warning about misuse

The following use is inappropriate and has to be prevented:

- Use under other conditions and prerequisites than those specified by the manufacturer in his technical documents, data sheets, operating and assembly instructions and other specifications.
- The repair of detectors that are used in explosion hazardous areas by persons who were not authorized by BERTHOLD TECHNOLOGIES.
- Using the device in a damaged or corroded condition.
- Operation with open or inadequately closed cover.
- Operating with inadequately tightened adapters and cable fittings.
- Operation without paying attention to the manufacturer’s safety precautions.
- Manipulating or bypassing existing safety installations.

Maintenance

The measuring system of the SENSseries LB 480 may only be installed, serviced and repaired by trained persons (see chapter 3.2, page 1-20).

Repair

Spare parts for detectors used in the Ex-area may be assembled only by the BERTHOLD TECHNOLOGIES service or by persons authorized by BERTHOLD TECHNOLOGIES. If this is not possible, you have to replace the entire detector or return it to the manufacturer for repair.

Parameter settings

Never change the parameter settings without a full knowledge of this User’s Manual, as well as a full knowledge of the behavior of the connected controller and the possible influence on the operating process to be controlled!

Sources and shieldings

This measuring system uses radioactive sources. The radiation protection instructions in this User’s Manual and the relevant statutory provisions are to be observed strictly, see also chapter 8, "Visual Inspection", page 1-111.
3 Qualification of Personnel

At different parts in this User’s Manual, reference is made to personnel with certain qualifications who can be entrusted with different tasks during the installation, operation and maintenance. These three groups of people are:

1. Persons with a general knowledge, see chapter 3.1.
2. Experts, see chapter 3.2.
3. Authorized persons, see chapter 3.3.

The following chapters explain the meaning of these terms and the prerequisites for the particular group of people.

**IMPORTANT**

All work on and with the measurement systems SENSseries LB 480 must be performed by persons having at least a general knowledge; they must always be guided by an expert or an authorized person.

### 3.1 Persons with a General Knowledge

Persons with a general knowledge are e.g. technicians or welders who can undertake different tasks during the transportation, assembly and installation of the measuring systems SENSseries LB 480 under the guidance of an authorized person. This can also refer to construction site personnel. The persons in question must have experience in the transportation and assembly of heavy component parts.

Persons working with Ex devices must in addition have knowledge on how to work with these devices, for example, that the devices must not be subject to mechanical damage (blow, etc.).

**IMPORTANT**

Persons with a general knowledge must always be guided by a trained expert at the very least. When dealing with radioactive substances, a Radiation Safety Officer must also be consulted.
3.2 Experts

Experts are persons who have sufficient knowledge in the required area due to their specialist training and who are familiar with the relevant national health and safety regulations, accident prevention regulations, guidelines and recognized technical rules. Expert personnel must be capable of safely assessing the results of their work and they must be familiar with the content of this User’s Manual.

3.3 Authorized Persons

Authorized persons are those who are either designated for the corresponding task due to legal regulations or those who have been authorized by BERTHOLD TECHNOLOGIES for particular tasks. When dealing with radioactive materials, a Radiation Safety Officer must also be consulted.
Transport and Assembly

The weight of the source shielding may be up to several 100kg, depending on the version. Please keep in mind:

- The bearing capacity of the vessel walls or the brackets must be suitable for installation of the source with the shielding and the detector. Otherwise, system parts may fall off and cause severe injuries or bodily harm with fatal consequences.
- Make sure that the mechanical stability of the fixing devices matches the weight of the shielding.

Please keep in mind:

- Never step under hovering loads while unloading heavy system parts!
- Only use tested lifting equipment matching the transport weights.
- Maintain adequate safety margin.
- Wear hard hat and safety shoes.
- Always ensure good stability for all types of use.
- Make use of the prepared mounting options.
- Work during assembly and installation of heavy and unwieldy subassemblies should be carried out by at least two people.
- System components must be mounted vibration-free.
- Take the weight (approx. 1.5 kg) of the housing cover into consideration when open and closing it so that it doesn't smash down.

5.1 Declaration of Conformity

EC-Declaration of Conformity

We, hereby declare under our sole responsibility that the design of the following products / systems / units brought into circulation by us comply with the relevant EC regulations.

This declaration loses its validity should modifications or unsuitable and improper use take place without our authorisation.

RoHS 2011/65/EG

Explosion 94/9/EC

RoHS 2011/65/EG

Explosion 94/9/EC

Enlisted body: 0102 PTB Braunschweig, Germany

This declaration is issued by the manufacturer

BERTHOLD TECHNOLOGIES GmbH & Co. KG
Calmbach St., D-75323 Bad Wildbad, Germany

released by

Dr. Jürgen Briggmann

Head of R&D
Bad Wildbad, 13th of December, 2013
5.2 General Information

This safety manual provides operating instructions in accordance with the directive 94/9/EG, the standards mentioned in the declaration of conformity, the National Electrical Code (NEC: ANSI/NFPA 70) and the Canadian Electrical Code (CEC).

National responsible authorities can claim additional requests.

Please observe the instructions given in this safety manual to avoid personal injury and property damage and to ensure safe operation.

5.3 Improper Use

Warning about misuse

The following use is inappropriate and has to be prevented:

- Use under other conditions and prerequisites than those specified by the manufacturer in his technical documents, data sheets, operating and assembly instructions and other specifications.
- The repair of detectors that are used in explosion hazardous areas by persons who were not authorized by BERTHOLD TECHNOLOGIES.
- Using the device in a damaged or corroded condition.
- Operation with open or inadequately closed cover.
- Operation with
  - inadequately sealed glands,
  - inadequately tightened or damaged screwed fittings, i.e. cable glands, adapters and sealing plugs.
- Operation without paying attention to the manufacturer’s safety precautions.
- Manipulating or bypassing existing safety installations.
5.4 Safety Instructions

5.4.1 Safety Instructions for Assembly and Operating Personnel

Assembly, installation, commissioning, operation and maintenance must only be carried out by authorized and trained personnel.

Before assembly/commissioning:

- Read the safety manual
- Read the operating manual
- Provide adequate training for assembly and operating personnel
- Ensure that the contents of the safety manual and the operating manual is fully understood by the relevant personnel.

If you are unclear:

- Contact the manufacturer.
- Repair

Repair

Spare parts may solely be assembled by the BERTHOLD TECHNOLOGIES service or by persons authorized by BERTHOLD TECHNOLOGIES. If this is not possible, you must replace the entire detector or return it to the manufacturer for repair.
5.5 Application Range and Technical Data

5.5.1 Ex-protection and temperature limits

Test certificates:
- PTB 11 ATEX 1032 X
- IECEx PTB 12.0038X
- CSA 70009819

Protection type:
- IP66 / IP68 according to IEC 60529
- IP69K according to ISO 20653
- NEMA Type 4X

Air pressure: 80 kPa (0.8 bar) to 110 kPa (1.1 bar)
Oxygen content of the air, typically: 21% (Vi/V)
## 5.5.2 Detector Versions and Application Range for ATEX/IECEx/NEC/CEC

<td>$I_m = 20 \text{ mA}$</td>
</tr>
</tbody>
</table>

2) Only for connection to RS485 interface circuits other LB 480 detectors

Please note that the maximum permissible ambient temperature at the detector surface should not be exceeded in case of failure of any connected water cooling.

Please refer to the technical data of the operating manual for information on the ambient temperature of the water cooling required so protect the electronics from damage by overheating.

The max. ambient temperature decreases when the detector is not mounted freestanding; the maximum surface temperature must not be exceeded.
### 5.5.5 Electrical safety characteristics of the associated equipment

</tr>
</tbody>
</table>
In gas atmospheres, when selecting group IIB or IIC for the intrinsically safe circuits, all intrinsically safe circuits and the LB 480 detector must be operated completely in the selected group IIB or IIC.

Installation of the probe with protection level "ia" allows the safe use of measuring instruments that otherwise may be used only in zone 0 or zone 20.
5.6 Installation

- Observe the installation and safety instructions in the operating manual.
- Install according to manufacturer's instructions and applicable standards and regulations.
- Do not operate device outside of the electrical, thermal and mechanical characteristics.
- Install the housing cover and the screwed fittings (cable glands, adapters and sealing plugs) correctly to maintain the housing protection.
- Unused entries must be sealed with metal sealing plugs.
- Please note also the operating and assembly instructions of the screwed fittings.
- Evidence of intrinsic safety has to be provided prior to the installation of intrinsically safe circuits (see IEC 60079-14). The connection of measuring and test equipment must be considered! The installation must be carried out based on this proof.
- Connect the electrical equipment to the local potential equalization.
- With shielded cables, the shielding has to be placed on the detector side. Observe an adequate insulation >500 V between the screen and the lines.
- The current output and the open-collector circuit are each floating and have a dielectric strength of at least 500 V_eff. The circuit of the resistance thermometer is electrically connected to the PA port. For the supply voltage the dielectric strength is at least 1500 V_eff.
- Use a connection cable that is permitted and suitable for the application conditions. Observe local regulations!
- The connection cable (conductor and insulation) must be suitable for a continuous operating temperature ≥ Ta +15 K.
- Connected cables must be installed strain-relieved and fixed.
- Do not disassemble the detector housing from the detector base (see Bild 5-6).
- Use the detectors exclusively for stationary installation.
- Devices that were used in "non Ex-areas" must not be used in Ex-areas.
- The plan (checklist on page 1-53) for the control of the terminal compartment has to be completed before commissioning and every time the terminal compartment has been opened.
5.6.1 Increased Safety "e" in the Terminal Compartment

Housing Cover

- Take the weight (approx. 1.5 kg) of the housing cover into consideration when open and closing it so that it doesn't smash down.

- Install all four Allen screws (cylinder screws ISO 4762 M5 x 20 - A4 - 70) for the housing cover with a torque of 4 Nm. Use spring washers (DIN 127 - B5 - 1.4310) for housing covers with flat gaskets. For housing covers with O-Rings, use Nord-Lock-washers (NL SS).

Screwed fittings

- Use only metallic screwed fittings and M20 x 1.5 screwed fittings suitable for the type of protection, depending on their application, but at least IP65.

- Only screwed fittings are permitted for ambient temperatures between -20° C and +40° C that technically meet at least the standard listed on the cover page of LB 480 EC type-examination certificate. Only screwed fittings which have been approved by BERTHOLD TECHNOLOGIES may be used outside this temperature range.

- Use only cables and fittings approved in accordance with local installation regulations. This could require special cables to prevent gas migration and, in particular, fittings with compound filling.

- Use only screwed fittings that are suitable for the type of cable (reinforced, non-reinforced, ...) and the cable cross-section.

- When using adapters for thread adjustment (e.g. thread reduction), only one adapter may be used in each cable gland.

- Replace the screwed fittings only by screwed fittings of the same type.
Terminals

- Permissible wire cross-section:
  - with ferrules \(0.5 - 1.5 \text{ mm}^2\)
    (AWG 21 - 16 flexible)
  - without ferrules \(0.5 - 2.5 \text{ mm}^2\)
    (AWG 21 - 14 flexible or solid)

- Both stranded leads as well as solid wires are permitted.

- To connect stranded leads, the following can be used: Ferrules or direct insertion of the strand into the terminal.
  The connection of fine-wire stranded lead class 6, according to IEC 60228, is only permitted with ferrules.

- Install the connecting cables in the terminal compartment so that ...
  - dirt and moisture is avoided in the terminal compartment;
  - the wires are not damaged when stripping.
  - the conductor insulation or the collar of the ferrule extends into the housing of the terminal body;
  - bare conductive parts of the lines (e.g. small wires of a strand) do not protrude from the terminal body;
  - the length of the ferrule or the stripped wire must be 10 mm, so that the wire is securely held in the spring-type terminal;
  - if ferrules are used, the conductor insulation extends into the collar of the ferrule;
  - clamped conductors and ferrules in the terminals must comply with a pull-out test according to DIN 46228 for 1 minute:
    - 30 N tensile force for 0.5 mm\(^2\) cross-section and
    - 50 N tensile force for 2.5 mm\(^2\) cross-section
  The crimped conductors in the ferrules must also pass this tensile test.
5.6.2 **Intrinsically Safe Installation Ex "i"**

The sections "Screwed fittings" and "Terminals" in chapter 5.6.1 also apply to the intrinsically safe installation.

- The housing cover (metal lid) covers the entire terminal compartment (see Bild 5-3, top).
- Take the weight (approx. 1.5 kg) of the housing cover into consideration when open and closing it so that it doesn’t smash down.
- Install all four Allen screws (cylinder screws ISO 4762 M5 x 20 - A4 - 70) for the housing cover with a torque of 4 Nm. Use Nord-Lock-washers (NL SS).
- Seals of the screwed fittings must be designed in such a way that the separation between intrinsically safe and non-intrinsically safe terminal room is not voided.
- The semicircular plastic cover (Ex-e cover) covers the non-intrinsically safe terminals (see Bild 5-3, bottom).
- The Ex-e cover must prevent access to non-intrinsically safe circuits with IP30 protection.
- After installation, the Ex-e cover must completely cover the terminal compartment for the power supply and RS485 interface again.
- Both screws (flat head screw ISO 7045 - M3 x 8 - 4.8) for fixing the Ex-e cover must be mounted.
- The housing cover is mounted correctly only if the pin on the Ex-e cover smoothly clicks into the blind hole of the housing cover.
- With intrinsically safe versions
  - the metal cover to the terminal compartment may be opened only for a short time for testing and adjustment.
  - the semicircular cover in the terminal compartment may be opened only if the terminal compartment is no longer energized and no explosive atmosphere is present.
- Devices with intrinsically safe circuits must not be connected to intrinsically safe circuits any more if they have not been used intrinsically safe before.
5.6.3 Explosion Proof (XP)

The paragraph "Terminals" in chapter 5.6.1 is also valid in this chapter.

- The threads (cable entries 1/2" NPT and housing cover) must be protected against damage.
- The threads (cable entries 1/2" NPT and housing cover) must be protected against moisture and corrosion. Therefore always lubricate the complete thread with grease OKS 217 in order to achieve the degree of protection NEMA Type 4X.

Housing Cover

- Take the weight (approx. 1.5 kg) of the housing cover into consideration when open and closing it so that it doesn't smash down.
- Fix the housing cover thoroughly (>10 turns), til the O-Ring is covered. Tight the housing cover with a torque moment of 25 Nm.

Cable Glands

- Only use metallic cable glands with 1/2" NPT thread.
- Only use cable glands that correlate to the local valid standards and legal regulations.
- When using conduits, install sealing boxes direct at the cable entries.
5.6.4 Commissioning

- The HART® Communicator used must be capable of operating within the respective Ex zone.
- For intrinsically safe current output, the HART® Communicator must also be intrinsically safe. The level of protection (ia, ib, ic) of the Communicator must be at least the level of protection of the installed circuit.

5.6.5 Protection Principle Ex-d/-e/-t and XP

- Do not open the terminal compartment while voltage is applied.
- If there is an explosive atmosphere: Waiting time before opening the electronics compartment after turning off the power supply: 2 minutes.
- Continued operation is not allowed if:
  - the detector is damaged
  - threads on the housing are corroded
  - the detector housing is badly corroded
  - dummy plugs are badly corroded or damaged
  - cable glands are corroded or damaged
  - adapters are badly corroded or damaged
  - seals are damaged, show visible aging, or settlement.

5.6.6 Protection Principle Ex-d/-e/-i/-t (intrinsically safe current output)

When opening the terminal compartment during operation, please keep in mind:

- The housing cover may only be opened for a short time for repair and maintenance.
- The semicircular cover (Ex cover) must remain closed as long as the supply voltage is applied.
- Please proceed as described in chapter 5.2.4 if the non-intrinsically safe part of the terminal compartment is to be opened. Waiting time before opening the Ex-e cover after turning off the power supply: 2 minutes.

### 5.7.4.4 Installation Instructions Cable Fittings and Dummy Plug

The cable glands are used only for the introduction of fixed cables. Please note the torques, cross sections and protection types of the screwed fittings in the following table.

The torques specified in the table below are typical values for the screwed fittings listed in the table, which essentially depend on the cable used. The pressure screw must be tightened so that the IP protection is permanently guaranteed.

5.8 Maintenance and Visual Inspection

For detectors that are used in hazardous areas, the detector housing (*Bild 5-6*) and thus the pressure-proof enclosure of the electronics may be opened only by the BERTHOLD TECHNOLOGIES service or by persons authorized by BERTHOLD TECHNOLOGIES.

*Bild 5-6  Detector housing with connection head with M20 cable entries for zone classification*

For commissioning, maintenance or repair, always use the checklists in *chapter 5.8.1* and *chapter 5.8.2* to document the accuracy and completeness of your work.

*Fig. 5-7  Detector housing with connection head for Class/Divisions with 1/2" NPT cable entries*
Visual inspection

Carry out regular visual inspections of the SENSseries measuring system, at least once every three years. To do this, use the visual inspection plan in *chapter 5.8.1*. Take appropriate actions immediately if you detect damage in the course of the visual inspection; if necessary, disconnect the detector from power supply immediately.

To determine the inspection intervals for the visual inspection, take the following conditions into consideration:

- ambient conditions (temperature, humidity, corrosive atmosphere, shock and vibrations)
- operating conditions (degree of utilization, operating errors)
- major changes in the overall system (e.g. changes in zoning)

Seals

If the cover or the housing is opened, check the respective seals and replace them, if necessary.

Cleaning

Take care not to damage the cable glands and the type plates during cleaning. Remove coarse debris with a stainless steel wire brush. Grinding, filing or chipping away deposits with the hammer is not permitted.
### 5.8.1 Plan for Visual Inspection of the Detector

If you answer one of the following questions with "No", you have to record the action you have taken to remedy this deficiency in the last column. Make sure before you take the device into operation again that the provisions you have taken are correct by consulting with the person in charge of explosion protection.

**Test in the terminal compartment**

- Is the interior (terminal compartment) in perfect order?
- Is the interior dry, clean and free of foreign material?
- Are the cables connected firmly?
- Are the terminals in perfect order?
- Is the interior free of corrosion?
- Is the insulation free of damages or trails?
- Is the mechanical fastening of the fixtures in good working order?
- Is the detector installed according to the local constructor regulations (e.g. EN 60079-14)?
- Does the cable insulation extend into the terminal compartment?
- Does the wire isolation reach into the sleeve of the terminals, respectively the sleeve of the ferrules?
- When using ferrules: Does the sleeve of the ferrule extend into the terminal sleeve?
- Are all the wires of a fine-wire strand covered by the terminal and clamped?
- Is the grounding conductor properly installed?
- Is the screened cable properly insulated electrically up to the terminal (e.g. with shrink tubing)?

Sensseries LB 480
BERTHOLD TECHNOLOGIES GmbH & Co. KG
SCHEDULE

EC-TYPE-EXAMINATION CERTIFICATE PTB 11 ATEX 1032 X

Description of equipment

The scintillation measuring unit of the LB 480 series is part of a measuring system for monitoring industrial processes. It is used for continuously measuring the level in tanks or bins that contain liquid, granular, viscous or encrustation-forming media, and for measuring conveyor belt charges, and the density of liquids, suspensions, slurries and bulk solids. It is also used for continuously measuring level, weight per unit area, ash, sulphur, hydrogen and other specific application.

The measuring principle is based on the absorption of gamma rays. The radiation source does not form part of the measuring unit and is therefore not included in the above type approval either.

The field of application is the installation in zones 1 or 2 (dust: 21 or 22, resp.). The unit consists of a scintillation detector with the required analysing electronics, which are housed in one common enclosure.

The enclosure can be provided with a water-cooling system to be able to cool the electronics system.

Structure

The scintillation measuring unit consists of two compartments (terminal and pressure compartment) for which sealing units (O ring and flat seal) are used for compliance with IP66 / IP68 / IP69K protection requirements. The terminal compartment is designed for supply and signalling purposes and interface connection. The pressure compartment comprises the photo multiplier with downstream voltage divider/pre-amplifier board, signal processing board, CPU board, analog, digital and fieldbus interfaces, and the power supply modules.

Type code and versions

The different versions are distinguished by two characters (the small x in the version identifier is used as a wildcard character). The first numeric character distinguishes between the following detectors:

- Version A$: rod detectors with plastic scintillator
- Version B$: point detectors with NaI scintillator
- Version C$: detectors with glass window for tower-sens or super-sens

The second numeric character distinguishes between different kinds of terminal compartments:

- Version x1$: flameproof enclosure-type terminal compartment
- Version x2$: increased safety-type terminal compartment

SCHEDULE TO EC-TYPE-EXAMINATION CERTIFICATE PTB 11 ATEX 1032 X

(17) Special conditions
Repairs on flameproof joints may only be performed in accordance with the manufacturer's design specifications. Repair on the basis of the values in tables 1 and 2 of EN 60079-1 is not permitted.

Additional notes for safe operation:

Connection conditions
If the terminal compartment is of the flameproof enclosure type, the following requirements must be observed:
1. The scintillation measuring unit of the LB 480 series shall be connected with suitable cable glands or conduit systems that meet the requirements stipulated in EN 60079-1, sections 13.1 and 13.2, and for which a separate test certificate has been issued.
2. Cable glands (Pg type glands) and blanking plugs of a simple design must not be used. If the scintillation measuring unit is connected by means of a conduit entry fitting which has been approved for this purpose, the required sealing device shall be provided immediately at the enclosure.
3. Openings that are not used shall be sealed with the specifications in EN 60079-1, section 11.9.
4. If connection is made in the potentially explosive area, the connecting cables shall be connected in an enclosure that meets the requirements of an approved type of protection in accordance with EN 60079-0, section 1.

Components attached or installed (terminal compartments, bushings, Ex-type cable glands, connectors) shall be of a technical standard that complies as a minimum with the specifications on the cover sheet, and they shall have a separate examination certificate. The operating conditions specified in the component certificates must be complied with.

The connecting cables shall be of a quality that conforms with the thermal, chemical and mechanical requirements under field service conditions. The connecting cables shall be fixed and routed so that they will be adequately protected against damage.

The LB 480 scintillation measuring unit shall be included in the local equipotential bonding system.

These notes and instructions shall accompany each item of the electrical equipment in an adequate form.

(18) Essential health and safety requirements
Met by compliance with the afore-mentioned Standards.

1. Supplement
according to Directive 94/9/EC Annex III.6

to EC-TYPE-EXAMINATION CERTIFICATE PTB 11 ATEX 1032 X

(Translation)

Equipment: Scintillation measuring equipment series LB 480

Marking: Ex db IIIC T6
Ex tb IIIC T80 °C

Manufacturer: Berthold Technologies GmbH & Co. KG

Address: Calmbacher Str. 22, 75323 Bad Wildbad, Germany

Description of supplements and modifications

The scintillation measuring equipment series LB 480 is part of a measuring system for monitoring industrial processes. It is used for continuous measuring of levels in tanks or bins that contain liquid, granular, viscous or encrustation-forming media, and for measuring conveyor belt charges, as well as the density of liquids, suspensions, slurries and bulk solids. It is also used for continuous measuring level, weight per area, ash, sulphur, hydrogen and other specific applications.

The measuring principle is based on the absorption of gamma rays. The radiation source does not form part of the measuring equipment and is not part of this assessment.

The scintillation measuring equipment consists of a scintillation detector with associated electronics in a common housing type of protection Flameproof Enclosure "d" or in type of protection Dust Protection by Enclosure "i".

The series LB 480 of scintillation measuring equipment is extended to versions of associated electrical apparatus for the signal outputs OC-input, PT100 and HART current output in type of protection Intrinsic Safety "i".

The power supply and the interface RS485 are designed as non-intrinsically safe circuits.

The connector housing integrated with the detector-housing is equipped either in type of protection Flameproof Enclosure "d", or in type of protection Increased Safety "e" or in type of protection Dust Protection by Enclosure "i" or in each case in combination with the type of protection Intrinsic Safety "i" equipped.

The relevant options are listed in a new type key and read in future as indicated below.

The relationship between variation, type of protection, temperature class and ambient temperature is re-codified and is listed in the table below.
The marking of the equipment changes and reads in the future as follows.

HART- current output (Sink Mode)
(Terminal 17, 18)

Type of protection Intrinsic Safety Ex ia IIB/IIC.
Only for connection to a certified intrinsically
safe circuit. Maximum Values:

- $U_i = 30 \text{ V}$
- $I_i = 152 \text{ mA}$
- $P_i = 1.14 \text{ W}$
- $C_i = 3 \text{ nF}$
- $L_i = 20 \text{ µH}$

The HART current output (source mode or sink mode) of the current output module are safely
electrically isolated from earth and all other circuits.

Special conditions for safe use

For the future the special conditions and the notes for manufacture and operation are redefined
as follows:

1) Due to the requirements of clause 5.1, EN 60079-1 it shall be pointed out that the joint
dimensions of the flameproof enclosure deviate from the values tabulated in EN 60079-1.
Repairing of flameproof joints exclusively according to the values specified in table 1 or
table 2 of EN 60079-1 is not permitted and may only be carried out in accordance with
the constructive specifications given by the manufacturer.

2) The interface circuit RS485 serves exclusively for intercommunication of the probes and
shall not be connected to an external RS485 circuit.

3) In gas atmospheres for the choice of group IIB or IIC for the intrinsically safe circuits, all
intrinsically safe circuits and the scintillation meter LB 480 series shall be fully operated
in the selected group IIB or IIC.

Approved for issue on behalf of the IECEx Certification Body: Dr.-Ing. U. Johannsmeyer

Position: Head of department "Explosion Protection in Sensor Technology and Instrumentation"

Signature:  

(for printed version)  

Date: 2013-12-06

1. This certificate and schedule may only be reproduced in full.
2. This certificate is not transferable and remains the property of the issuing body.
3. The Status and authenticity of this certificate may be verified by visiting the Official IECEx Website.
IECEx Certificate of Conformity

Certificate No.: IECEx PTB 12.0038X
Date of issue: 2013-11-28
Issue No.: 1

Manufacturer: Berthold Technologies GmbH & Co. KG
Calmbacher Str. 22
79323 Bad Wildbad
Germany

Additional Manufacturing location:
(5):

This certificate is issued as verification that a sample(s), representative of production, was assessed and tested and found to comply with the IEC Standard list below and that the manufacturer's quality system, relating to the Ex products covered by this certificate, was assessed and found to comply with the IECEx Quality system requirements. This certificate is granted subject to the conditions as set out in IECEx Scheme Rules, IECEx 02 and Operational Documents as amended.

STANDARDS:
The electrical apparatus and any acceptable variations to it specified in the schedule of this certificate and the identified documents, was found to comply with the following standards:

IEC 60079-0 : 2011 Edition 6.0: Explosive atmospheres - Part 0: General requirements
IEC 60079-7 : 2006-07 Edition 4: Explosive atmospheres - Part 7: Equipment protection by increased safety "e"

This Certificate does not indicate compliance with electrical safety and performance requirements other than those expressly included in the Standards listed above.

TEST & ASSESSMENT REPORTS:
A sample(s) of the equipment listed has successfully met the examination and test requirements as recorded in

Test Report:
DE/PTB/EXTR12.0052/01

Quality Assessment Report:
DE/PTB/QAR06.0011/03

75332 Bad Wildbad, Germany

Electrical Apparatus: Scintillation measuring equipment LB 480 series

Description of equipment

The scintillation measuring equipment series LB 480 is part of a measuring system for monitoring industrial processes. It is used for continuous measurement of the level in tanks or bins that contain liquid, granular, viscous or encrustation-forming media, and for measuring conveyor belt charges, as well as the density of liquids, suspensions, sludges and bulk solids. It is also used for continuous measurement of level, weight per area, ash, sulphur, hydrogen and other specific applications.

The measuring principle is based on the absorption of gamma rays. The radiation source is not part of the measuring equipment and is not part of this certificate.

The scintillation measuring equipment consists of a scintillation detector with associated electronics in a common housing in type of protection Flameproof Enclosure “d” or in type of Dust Protection by Enclosure “e”.

The series LB 480 of scintillation measuring equipment is extended to versions of associated electrical apparatus for the signal outputs OC-input, PT100 and HART current output in type of protection Intrinsic Safety “i”.

The power supply and the interface RS485 are designed as non-intrinsically safe.

The integrated connector housing with the detector-housing is equipped either in type of protection Flameproof Enclosure “d”, or in type of protection Increased Safety “e”, or in type of Dust Protection by Enclosure “i”, each in combination with the type of protection Intrinsic Safety “i”.

The relevant options are listed in a new type key and read in future as indicated below.

The relationship between variation, type of protection, temperature class and ambient temperature is re-coded and is listed in the table below.

### Type Code and Versions (variant):

The different versions are distinguished by two characters (the small “x” in the version identifier is used as a wildcard character). The first numeric character distinguishes between the following detectors:

- **Version Ax:** Rod detectors with plastic scintillator
- **Version Bx:** Rod detectors with NaI scintillator
- **Version Ex:** Detectors with glass window for tower-sens or super-sens

The second numeric character distinguishes between different kinds of terminal compartments.

- **Version x1:** Flame Proof Enclosure type terminal compartment.
- **Version x2:** Increased Safety type terminal compartment.

MARKINGS

The manufacturer is required to apply the following markings:
Products shall be marked with the markings specified by the particular product standard. Products certified for Canada shall have all Caution and Warning markings in both English and French.

Additional bilingual markings not covered by the product standard(s) may be required by the Authorities Having Jurisdiction. It is the responsibility of the manufacturer to provide and apply these additional markings, where applicable, in accordance with the requirements of those authorities.

The products listed are eligible to bear the CSA Mark shown with adjacent indicators ‘C’ and ‘US’ for Canada and US (indicating that products have been manufactured to the requirements of both Canadian and U.S. Standards) or with adjacent indicator ‘US’ for US only or without either indicator for Canada only.

**Nameplate label material approval information:**

1. Submittor's name, trademark, or the CSA file number (adjacent the CSA Mark).
2. Catalogue / Model designation.
3. Complete electrical rating (amps, hertz, and volts).
4. Serial number traceable to month and year of manufacture.
5. Hazardous Location Rating
6. Ambient temperature ranges and applicable Temperature code
7. Ingress Protection Rating
8. The CSA Mark with the “c” and “us” qualifiers.
9. The following bilingual cautions: (as applicable)

## 5.11 FM Certificate

### CERTIFICATE OF CONFORMITY

1. **HAZARDOUS (CLASSIFIED) LOCATION ELECTRICAL EQUIPMENT PER US REQUIREMENTS**
2. **Certificate No:** FM16US0282X
3. **Equipment:** LB 480 Series Scintillation Measurement Equipment
4. **Name of Listing Company:** Berthold Technologies GmbH & Co. KG
5. **Address of Listing Company:** Calmbacher Strasse 22 75323 Bad Wildbad Germany
6. **The examination and test results are recorded in confidential report number:** 3054263 dated 22nd September 2016
7. **FM Approvals LLC, certifies that the equipment described has been found to comply with the following Approval standards and other documents:**
   - FM Class 3600:2011, FM Class 3615:2006, FM Class 3616:2011,
8. **If the sign ‘X’ is placed after the certificate number, it indicates that the equipment is subject to specific conditions of use specified in the schedule to this certificate.**
9. **This certificate relates to the design, examination and testing of the products specified herein. The FM Approvals surveillance audit program has further determined that the manufacturing processes and quality control procedures in place are satisfactory to manufacture the product as examined, tested and Approved.**
10. **Equipment Ratings:**
    - Explosionproof for Class I, Division 1, Groups A, B, C and D; Dust-ignitionproof for Class II, Division 1, Groups E, F and G; and Class III, Division 1 hazardous (classified) locations, indoors and outdoors (Type 4X) with an ambient temperature rating of -40°C to +65°C (or +80°C).

**Certificate issued by:**

J.E. Marquedant  
Manager, Electrical Systems

22 September 2016

To verify the availability of the Approved product, please refer to [www.approvalguide.com](http://www.approvalguide.com)
SCHEDULE

US Certificate Of Conformity No: FM16US0282X

11. The marking of the equipment shall include:

   Class I Division 1, Groups A, B, C, D
   Class II, III, Division 1, Groups E, F, G
   T6, Ta = -40°C to +65
   T5, Ta = -40°C to +80°C
   Type 4X

12. Description of Equipment:

   General - The LB 480 Series Scintillation Measurement Equipment is used as part of a measuring system for monitoring industrial processes. The equipment is used for continuously measuring the level or weight per unit area, in tanks or bins, of liquid, granular, viscous or encrustation-forming media and for measuring conveyor belt charges as well as the density of liquids, suspensions, slurries and bulk solids. The measurement principle is based on the absorption of gamma rays. The radiation source is not part of the measuring equipment and is not included in the product Approval.

   Construction - The LB 480 Series Scintillation Measurement Equipment consists of a scintillation detector with associated electronics in an explosionproof/dust-ignitionproof enclosure with separate sensor and wiring compartments. The sensor and wiring compartments are separated by NRTL listed cemented feedthroughs. The sensor and housing (socket) are constructed of 304 or 316 stainless steel. The wiring compartment contains four ½-inch NPT entries and contains a threaded cover. The socket attaches to the sensor by cylindrical joint fastened with six bolts. The bolt holes terminate under the threaded cover inside the wiring compartment and therefore contain six threaded plugs to form a valid flamepath. The equipment is available with an optional window which is cemented into the sensor.

   Ratings - The equipment is rated for use in an ambient temperature of -40°C to +65°C (or +80°C). The equipment operates at 100-240 Vac (12 VA) or 24 Vdc (12 W).

   LB 480-a-bA-cd-ef-0g0-h. Scintillation Measurement Equipment.
   a = Sensor: 11, 12, 13, 14, 15, 16, 2A, 2B, 2E, 2F, 2I, 2J, 2K, 2L, 31, 32, 41, 42, 43 or 44.
   b = Approval: F or G.
   c = Signal output: 0 or 1.
   d = Power supply: 1 or 2.
   e = Collimator: 0, a, r, f or s.
   f = Housing material: 1 or 3.
   g = SIL: 0 or S.
   h = Software: 0, S, T, U, V, W, L, M, N, O, D, E, F, G, H, J, P or K.

13. Specific Conditions of Use:

   The ambient temperature range and T-code rating for the equipment is as follows:

Electrical Installation

The electrical installation may be carried out only by a qualified electrician.

Electrical hazards

---

**WARNING**

Danger to life due to electrical shock!

Open the housing only to perform installation, maintenance and repair work.

When the housing is open, you may come into contact with live parts if the power supply is connected. During installation and maintenance work on the hardware of the detector you have to switch off the measuring system, possibly connected relay contacts, and all the inputs and outputs in order to avoid contact with live parts.

---

Never modify the installation without having thoroughly read this User's Manual.

Cable glands, adapters and dummy plugs

The screwed fittings must be suitable for the intended use (ATEX or FM/CSA).

If the detector is not used in explosion hazardous areas, the screwed fittings, adapters and dummy plugs have to be tested in accordance with at least one of the following guidelines or standards:

- EN50262
- UL1565
- C22.2 No. 0.17.92
- ATEX

At ambient temperatures of -20 to +40°C, only metallic cable glands and metal adapters may be used to comply with the protection class IP 65. The material properties of the cable glands, adapters and dummy plugs used must be suitable for the ambient conditions existing at the measuring location.

At ambient temperatures above 40°C and below -20°C, only the cable glands tested and approved by Berthold may be used.

The tightening torques for the cable glands supplied by BERTHOLD TECHNOLOGIES are listed on page 1-47.

Please note that only one adapter per cable entry may be used. It is not permitted to screw together several adapters.

The total length of the cable glands, including any adapter must not exceed 10 cm.

Cable conduits that are not used must be closed by suitable, metallic dummy plugs.
Special cable glands are required for reinforced cables. The cable assembly is described in the installation instructions of the cable conduit used.

In case of doubt, we recommend using screw fittings, dummy plugs or adapters by BERTHOLD TECHNOLOGIES.

### Cables and wires

Only use cables with diameters that are permitted for each cable gland. The cables must have the following wire cross-sections:

- **Power cord**: 1 mm² to 2.5 mm²
- **Signal lines**: 0.5 mm² to 2.5 mm²

The cables used must be suitable for at least a temperature which is 15°C above the maximum ambient temperature.

If intrinsically safe signal lines pass through areas with explosive dust atmospheres or through the zone 0, then they must be protected against static discharge.

The cables must not be subjected to tensile stress, but have to be installed strain-relieved. We recommend creating a cable loop in front of the entry of the housing.

If there is a danger that the cable may be used as a stepladder, then the cables must be installed protected, for example in conduits. Also make sure that the cables that are connected to the detector are laid without abrasion or kinks.

### Stranded lead

The ends of multi-strand wires or fine wire lines (strands) may not be tinned or soldered. Permitted variations are ferrules and direct connection of the strand.

**IMPORTANT**

When installing fine wire lines in a terminal, individual wires often get stuck at the edge of the terminal, are then pushed back and in the worst case project over the insulated edge of the terminal. Therefore, make sure that all multi-wire or fine wire lines are covered by the terminal and are clamped inside the terminal.

### Grounding conductor

The grounding conductor has to be connected to the terminals marked with PE. With interconnected detectors (multi-detector operation) the PE may not be looped from one detector to another. Therefore supply lines with PE have to be guided in a star-shaped pattern from one terminal box to the individual detectors.

### Potential equalization

Connect the detector to a equipotential busbar on site. The line on this bar must be as short as possible.

### Separator

A separator

- must be present (regulation according to EN 61010-1)
- must be easily accessible for maintenance personnel
- has to be included in the company's internal documentation

It can be installed in the form of a circuit breaker or as a switch and must meet the requirements of IEC 947-1 and IEC 947-3. If a fuse is used, it must trigger only at a current of greater than 4 amps per unit.
General points that are important for installation

**IMPORTANT**

*Open the terminal compartment in dry ambient conditions, not in the rain.*

*Moisture in the terminal compartment can both cause a short circuit with other lines or cancel the explosion protection.*

- Please follow the signs on the detectors.
- Connect the cables with special care.
- The connecting cable and its installation must comply with applicable regulations.
- Make sure when installing the cables that mechanical damage to the conductor insulation from sharp edges or moving metal parts will be ruled out. If necessary, install the cable appropriately protected, for example in conduits.
- Install the connecting cables in the terminal compartment so that
  - dirt and moisture is avoided in the terminal compartment;
  - the wires are not damaged when stripping;
  - the conductor insulation or the collar of the ferrule extends into the housing of the terminal body;
  - bare conductive parts of the lines (e.g. small wires of a strand) do not protrude from the terminal body;
  - the length of the ferrule or the stripped wire must be 10 mm, so that the wire is securely held in the spring-type terminal;
  - if ferrules are used, the conductor insulation extends into the collar of the ferrule;
  - the minimum bending radii permitted for the respective cross-section are not fallen below;
  - install the cables strain-relieved and without abrasion.
- The SENSseries detectors may only be operated with fully closed housing.
- Cleaning corroded threads at the cable glands or cable conduits using abrasives or a wire brush is not allowed.
- The use of the detectors is not permitted if:
  - cable fittings are corroded or damaged;
  - threads on the housing are corroded or damaged;
  - dummy plugs are badly corroded or damaged;
  - the housing of the detector is badly corroded or damaged;
  - seals are damaged, show visible aging, or reduction.
Functional Safety

7.1 Scope

This safety manual applies for radiometric measurement systems consisting of a radiation source and the measuring system of the SENSseries LB 480. The measuring system can be used in the following applications:

- Level measurement (also cascaded in a master-slave arrangement)
- Level detection (as max and min limit switches)
- Density measurement

![Diagram of measurement system components](image)

7.2 Use

The measuring device LB 480 may only be used as intended. Permissible measuring arrangements as well as the intended use are described in the operating manual.

For use in safety-related systems (Functional safety according to IEC 61508:2010 / 61511:2003) all information in this manual has to be considered.

The measuring device can be operated in the operating mode with low demand rate (low demand) or with high demand rate (high demand). For this purpose, the rules according to 7.4.5.3 of IEC 61508-2 regarding the demand rate must be observed specifically:

- up to SIL 2 with one detector LB 480
- up to SIL 3 with two detectors LB 480

Any use beyond the information given in this manual shall be deemed as being not in conformity with the intended use and may result in serious injury or property damage. BERTHOLD TECHNOLOGIES GmbH & Co. KG shall not accept any liability for such injury or damage.
7.3 Other Applicable Documents and Records

Depending on the design of the measuring system, the following documentation must be observed.

The SIL conformity is certified in the attached certificate.

7.4 Detector Identification

SIL-certified detectors are marked on the nameplate with the designation "SIL" and in the LB number key in addition with an "S" (see figure below).
7.5 Project Planning

7.5.1 Safety Function

The measuring system SENSseries LB 480 is used for non-contact measurement of level, density or concentration. A gamma radiation source (Co-60 and Cs-137) generates a radiation field which is attenuated or absorbed by the product to be measured and is detected by the scintillation detector LB 480.

The following descriptions are exemplary for the respective application. The safety integrity, that is the non-detected measured value deviation is <2%. If TowerSENS detectors are used the deviation is <5%. Information on the accuracy of the measurement can be found in the technical data section of the operating manual.

7.5.1.1 Level detection

The measuring system consists of a detector and a radiation source. These are mechanically positioned on the filling level and trigger an alarm once this level is reached. The safety function is to monitor the fill level of the product to be monitored at a defined fill level. This can be both an overfill and underfill protection.

Principle of measurement

As long as the level is below the beam path, the detector receives radiation from the radiation source and the signals "Empty". If the level rises and reaches the height of the beam path, then the radiation is absorbed by the product. The significantly reduced radiation intensity evaluates the detector signal as a "Full" signal.

The "Empty" signal is displayed on the analog current output with 4 mA, the "Full" signal with 20mA.
7.5.1.2 **Level measurement**

The measuring system consists of a detector and a radiation source. Both the detector and the radiation source may be designed rod-shaped or point-shaped. These are mechanically positioned so that the desired measuring range can be covered. The safety function is to monitor the fill level of the product to be monitored within the measuring range.

**Principle of measurement**

As long as the level does not reach the area of the beam path, the radiation arrives unhindered at the detector. Once the level is within the measuring range, part of the radiation is absorbed. This reduced radiation intensity is indicated at the detector as rising level. The more the level rises, the more the radiation is reduced, which the detector signals as a continuous level increase from 0 to 100%.

The level change from 0 ... 100% is represented by the analog current output 4 ... 20mA.
7.5.1.3 Density measurement

The measuring system consists of a detector and a radiation source. These are mechanically positioned such that the beam path runs through the product in order to detect the product density. The safety function is to monitor the fill level of the product to be monitored within a defined density measuring range.

**Principle of measurement**

A higher product density reduces the radiation intensity at the detector. A lower product density increases the radiation intensity at the detector. The change in radiation intensity is output in the detector as a continuous signal within the measurement range.

The detector signals the change in density via the analog current signal. The lower measuring range of the density corresponds to 4mA, the upper range corresponds to 20mA. The PT100 may be used for temperature compensation.
7.5.2 General Notes and Limitations

- The user-specific limits must be observed and the technical specifications must not be exceeded. See operating instructions.
- The container geometry on which the source-detector calculation is based must not differ from the one at the mounted measuring point. If there are any deviations, please contact BERTHOLD TECHNOLOGIES.
- Only the analog 4-20mA current output signal may be used for safety functions.
- The measuring signal may only be used by the control system when the Safety Mode is enabled.
- The RS485 interface must be used exclusively for the master-slave communication.
- The HART® multidrop mode is not allowed.
- If there are magnetic fields in the immediate vicinity of the measuring point, then you have to make sure through appropriate tests that the magnetic field intensity does not affect the measuring signal.
- Use only radiation sources with the isotope Co-60 or Cs-137.
- Only shieldings made by Berthold may be used.
- During operation, the source shielding may not be
  - closed
  - be changed in their position or removed
- It must be prevented that no additional absorber (e.g. steel plates) get into the beam path, which were not considered for commissioning.
- Any influence of adjacent radiometric measuring points should be avoided. If in doubt, the measuring point arrangement has to be discussed with BERTHOLD TECHNOLOGIES.
- Several detectors may be interconnected into a multi-detector system. In an interconnection, only one detector may be configured as a master detector.
- In a multi-detector system, the time constant must be > 2 seconds.
- The user is responsible for the validation of the safety function.
- The following types of detectors can only be used when all count rates within the measuring range are above 1000 cps.
  - LB 480-13 (CrystalSENS 40/35)
  - LB 480-14 (CrystalSENS 40/35 with water cooling)
  - LB 480-15 (CrystalSENS 25/25)
  - LB 480-16 (CrystalSENS 25/25 with water cooling)
These detectors can be operated only with detector code "0".
• Detector code "1" has to be used for the following types of detectors: when count rates of less than 1000 cps may occur within the measuring range. In the other case detector code "0" can be used.
  - LB 480-11 (CrystalSENS 50/50)
  - LB 480-12 (CrystalSENS 50/50 with water cooling)

• The error current (Loop Alarm Type) has following setup options:
  - High: >21mA
  - Low: <3.6mA

7.5.3 Assumptions

The evaluation of the measuring device according to functional safety aspects is based on the following assumptions:

• The failure rates are constant over the lifetime.
• The environmental conditions correspond to an average industrial environment.
• The repair time (replacement of the measuring system) after an interference immune error is 72 hours. \(\text{MTTR} = 72\)h.
• The maximum operating time is limited by the average count rate and the scintillator used:

<table>
<thead>
<tr>
<th>average count rate</th>
<th>maximum operating time</th>
</tr>
</thead>
<tbody>
<tr>
<td>CrystalSENS (Point detectors with NaI crystal)</td>
<td>10 years</td>
</tr>
<tr>
<td>UniSENS (rod detectors) SuperSENS TowerSENS</td>
<td>10 years</td>
</tr>
<tr>
<td>40000 cps</td>
<td>10 years</td>
</tr>
<tr>
<td>80000 cps</td>
<td>5 years</td>
</tr>
</tbody>
</table>

• A temperature compensation can be used for a density measurement.

The following error cases are not considered:

• Closing or removing the source
• Failure rates of external power supplies
• Multiple errors

1. MTTR = Mean Time To Repair
7.5.3.1 **Determination of the Failure Rates**

The failure rates of the device were determined by an FMEDA according to IEC61508. The calculations are based on component failure rates according to SN29500. All numerical values refer to an average ambient temperature during the operating time of 40°C (104°F). For higher temperatures, the values should be corrected:

- Continuous operating temperature 50 ... 60°C (122...140°F) by a factor of 1.3
- Continuous operating temperature 60 ... 70°C (140...158°F) by a factor of 2.5
- Continuous operating temperature 70 ... 80°C (158...176°F) by a factor of 4.5

Similar factors apply when frequent temperature fluctuations are expected.
7.6 Device Behavior during Operation

7.6.1 Device Behavior after Power On
After power on, a diagnosis phase of 15 seconds starts in which the measuring device is checked for errors. The current output changes to 24mA for 2 seconds and then to 0mA. During this time, no communication with the device is possible.

If an error is detected during the diagnosis phase, the device changes to fault current. In the other case, a current in the range between 3.8 ... 20.5 mA is output.

7.6.2 Behavior of the Current Output in Case of Error
If the measuring device detects a fault, the current output is brought to a safe condition.

Error >21mA or <3.6mA:
There is a hardware or software error.
Please refer to the operating manual for a detailed description of the error behavior.

7.6.3 Device Behavior in Case of Interference Radiation
The LB 480 is able to detect interference radiation caused, for example, by weld seam testing. If interference radiation is present, the measured value switches to fault current for the wait time set in the device. Overfilling or underfilling cannot be detected during this time. Even if the LB 480 is very sensitive when it comes to the detection of interference, one cannot rule out ultimately that specially low interference radiation influences may not be detected and the measured value is falsified. For this reason, it is generally necessary that the system operator is informed in advance and appropriate measures are taken to maintain the safe operation of the system.

7.7 Installation and Wiring
Installation and wiring is described in the relevant operating instructions.
If necessary, the following inputs can be connected and used:

- Pt100 for temperature compensation
- RS485 for cascading as a multi-detector system

The use of other inputs is not permitted in safety-related applications.
7.8 Commissioning

The following equipment may be used for commissioning:

- HART®-Communicator
- The PC-based control software LB 480-PC.

For commissioning, you should be familiar with the operating instructions (Level, Limit Level, or Density).

Carry out the following steps for commissioning:

1. Calibration (see User's Manual Volume 3, Chapter 5)

2. Enable Safety Mode
   
   Menu path: Device Config>Access>Safety ON
   
   With this setting, the security-compatible setting is checked and the detector LB 480 locked.
   
   The Safety Mode is maintained even if the device is turned off and then on again.

3. Check safety parameters and measured value
   
   Menu path: Diagnostic>Safety>Refresh Safety Status
   
   - First update Safety Stati.
     
     To do this, select parameter "Refresh Safety Status".
   
   - Then Safety Status 1, 2 and 3 have to show the value 0xFF.
     
     If not, the measurement cannot be used in a protection device. The measurement can be used in a protection device only when the settings are corrected so that 0xFF is displayed in the active "Safety Mode". If you need help, please see the brief explanation in the safety parameters in each menu of Safety Status 1, 2 and 3.

Please refer to chapter 7.9 "Periodic Inspections" so that the reference values for this test can be determined directly following the commissioning.
7.9 Periodic Inspections

The periodic performance test is used to check the safety function in order to detect possible non-recognizable dangerous errors and thus to test the operational capability of the measuring system at appropriate intervals. It is the responsibility of the operator to select the type of inspection.

The intervals depend on the PFD value used (see table in chapter 7.11).

The test has to be carried out so that the correct safety function can be established in the interaction of all components. The methods and procedures used in the tests must be stated and their suitability must be specified. The inspections have to be documented.

If the performance test is negative, the entire measuring system must be taken out of service and the process must be kept in a safe state by other measures.

The first test must be performed directly after the initial startup, so that the reference values and the general conditions are defined, and these are available in the following periodic inspections for reference.

![IMPORTANT](image)

*During the test, the person performing the test must ensure the safety-related monitoring of the process by other technical and/or organizational measures.*

7.9.1 Test Options

The options to test (proof-test) the measuring device as a component of the measuring system differ depending on the application the instrument is used for. The test options are listed below. Please note that this should be done under operating conditions, provided certain operating conditions have an impact on the measurement. For example, if there is a stirrer in the beam path, then the stirrer must be operated as under operating conditions. The same applies to a container under gas pressure, and to heating and cooling jackets, to name two further examples. It is the responsibility of the operator to select the type of inspection. The interval depends on the PFD used (see Table in chapter 7.11).
7.9.1.1  Limit Switch Application
The function in the Limit Switch application can be checked by controlling the response level in the course of a filling process. If filling is not feasible, the measuring system must be triggered to respond by an appropriate simulation of the level or the physical measuring effect.

7.9.1.2  Level Application
In the Level application, the function can be checked in the following manner:
1. Source open, container empty ? it must be possible to check the zero point.
2. Source closed, container empty ? measured value of the initial start-up must be reached under the same conditions.

7.9.1.3  Density Application
In the Density application, the function can be checked only by a reference liquid where we know the density. An example would be filling the measuring path with water. If this is not possible, a reference sample must be analyzed in the laboratory and its result has to be compared with the results of the measuring device.

In general, a 2-point tests leads to a higher safety level. A second point should have a fairly large distance from the first point. We recommend a difference between both points of >30% of the measuring range.

7.10  Repair
Repairs of the SENSseries LB 480 may be carried out at the manufacturer's works only.

7.10.1  Software Update
A software update must be carried out only by personnel authorized by BERTHOLD TECHNOLOGIES.

7.13 Functional Safety Certificate

CERTIFICATE
No. Z10 14 05 47128 001

Holder of Certificate: Berthold Technologies GmbH & Co. KG
Calmbacher Str. 22
75323 Bad Wildbad
GERMANY

Factory(ies): 47128

Certification Mark:

Product: Sensors
Measuring System

Model(s): SENSseries LB 480

Parameters:
Architecture 1oo1:
SiL2, SC3

Architecture 2oo2:
SiL3, SC3

Degree of Protection:
IP66 / IP68

Tested according to:
IEC 61508-1:2010
IEC 61508-2:2010
IEC 61508-3:2010

The product was tested on a voluntary basis and complies with the essential requirements. The certification mark shown above can be affixed on the product. It is not permitted to alter the certification mark in any way. In addition the certification holder must not transfer the certificate to third parties. See also notes overleaf.

Test report no.: BB85808T

Date, 2014-06-03  (Peter Weiss)

Page 1 of 1

TÜV SÜD Product Service GmbH · Zertifizierstelle · Ritterstraße 65 · 80339 München · Germany
Zertifiziervertrag

Grundlage für die Zertifikatserteilung ist die Prüf- und Zertifizierordnung von TÜV SÜD Product Service.

Mit Erhalt des Zertifikates erteilt der Zertifikatsinhaber die jeweils gültige Fassung der Prüf- und Zertifizierordnung an (www.tuev-sued.de/ps_regulations) und wird somit Partner im Zertifizierungsverfahren von TÜV SÜD Product Service.

Prinzipielle Voraussetzung für die Gültigkeit des Zertifikates:

– Gültigkeit der zitierten normativen Prüfgrundlagen ist gegeben

und zusätzlich bei Zertifikaten mit Berechti- gung zur Verwendung eines Prüfzeichens bzw. bei Zertifikaten für QM-Systeme:

– Voraussetzungen für vorschriftsmäßige Fertigung werden eingehalten.

Certification contract

Certification is based on the TÜV SÜD Product Service Testing and Certification Regulations.

On receipt of the certificate the certificate holder agrees to the current version of the Testing and Certification Regulations (www.tuev-sued.de/ps_regulations) and thus becomes partner in the TÜV SÜD Product Service Certification System.

Requirements for the validity of the certificate in principle:

– Validity of the quoted test standard(s)

in addition for certificates with the right to use a certification mark and for QM certificates:

– Conditions for an adequate manufacturing are maintained

– Regular surveillance of the facility is performed
Visual Inspection

Regular visual inspections of the measuring system SENSseries have to be carried out, at least once a year. To do this, use the visual inspection plan on page 1-51. Take appropriate actions immediately if you detect damage in the course of the visual inspection; if necessary, disconnect the detector from power supply immediately.

To determine the inspection intervals for the visual inspection, take the following conditions into consideration:

– Ambient conditions (outdoor, rain, sunlight, heat and cold).
– Operating conditions (utilization of system, operating errors)
– Measuring system is operated within or outside of an explosion hazardous zone.

Carry out a visual inspection before first commissioning and after any repair that requires opening of the detector cover and check the terminal compartment. Please use the visual inspection plan (Volume 1) on page 1-51 and the plan for checking the terminal compartment on page 1-53.
Recurring Function Test

The "Recurring Function Test" is used to check the safety function to detect possible non-recognizable hazardous errors.

It is the responsibility of the operator to select the type of test. The test shall be conducted so that the correct safety function is proven in the interaction of all components. This is ensured when approaching the response level in the course of a filling process. If filling is not practical, the measuring system has to trigger the response of the limit value by suitable simulation of the level, e.g. by closing the source shielding container.

The methods and procedures used during the tests must be stated and their suitability must be specified. The tests must be documented.

If the function test proves negative, the entire measuring system must be shut down and the process held in a safe condition by other means.
Radiation Protection

10.1 General Information and Guidelines

In order to prevent adverse health effects caused by working with radioactive substances, limits for the maximum permissible radiation exposure of operating personnel have been agreed upon on an international level. Appropriate measures in designing the shieldings and arranging the measuring system at the measuring site will ensure that the radiation exposure of the personnel will remain below the maximum permissible value of 1mSv (100mrem) per year.

To ensure safe operation and compliance with the legal regulations, the company has to appoint a Radiation Safety Manager who is responsible for all questions relating to radiation protection. The Radiation Safety Officer will monitor handling of the radiometric measuring system and, if necessary, formalize the safeguards and any special precautions applicable to a given establishment in formal procedural instructions, which in special cases may serve as a basis for radiation protection guidelines. Radiation protection zones outside the shielding must be – if they are accessible – marked and guarded. These instructions should also include checks of the shutter device of the shielding and actions in case of accidents – such as fire or explosion. Any special event has to be reported to the Radiation Safety Manager immediately. He will then investigate any damage and immediately take suitable precautions if he detects defects that may adversely affect the safe operation of the system.

The Radiation Safety Manager has to make sure that the provisions of the Radiation Protection Regulations are observed. In particular, his duties include instructing the staff on the proper precautions when working in the vicinity of radioactive substances.

Radioactive sources that are no longer in use or have reached the end of their service life must be returned to the national radioactive waste disposal center or to the manufacturer.

Generally, every member of staff should endeavor to minimize any radiation exposure—even within the permissible limits—by careful and responsible action and by observing certain safety standards.

The total sum of the radiation dose absorbed by a body is determined by three factors. On the basis of these factors, certain fundamental radiation protection rules can be derived: Distance, time and shielding.
Distance

This means the distance between the radioactive source and the human body. The radiation intensity (dose rate) decreases – like light – in proportion to the square of the distance, i.e. doubling the distance to the source reduces the dose rate to one quarter.

Conclusion:

Maximum distance should be maintained when working in the vicinity of equipment containing radioactive material. This is especially true for persons that are not directly involved in this work.

Time

The total time a person stays in the vicinity of a radiometric measuring system and the body is exposed to radiation. The effect is cumulative and increases therefore with the duration of the radiation exposure.

Conclusion:

Any work in the vicinity of radiometric measuring system must be prepared carefully and organized such that it can be carried out in the shortest time possible. Having the proper tools is of particular importance.

Shielding

The material surrounding the source provides the shielding effect. As the shielding effect depends, following an exponential function, on the product of thickness multiplied by the density, it follows that materials with a high specific weight are to be used for shielding purposes. The device designer usually calculates suitable dimensions.

Conclusion:

Before mounting or dismounting the shielding, make sure that the radiation exit channel is locked in the closed position.

During use

Installation, dismantling, relocation, maintenance, testing involving the radioactive source and its shielding shall ONLY be performed under the supervision of the Radiation Safety Officer.

For more information please contact BERTHOLD TECHNOLOGIES.
10.2 Mounting the Shielding

10.2.1 Safety Instructions

The shielding container consists of a lead-filled, stable cast housing. A rotary shutter is installed to close the radiation exit channel. Operation is carried out from behind by a T-handle, which is secured by a padlock in open as well as in closed position. The locking prevents that the radiation path can be closed or opened by unauthorized persons. Also is prevents that unauthorized persons can remove the source.

Radiation exposure during installation

To keep the radiation exposure of the assembling personnel as low as possible, only licensed personnel who have been trained on how to handle radioactive substances are allowed to assemble or disassemble the shielding with the source. The work is performed according to the instructions and under the supervision of the Radiation Safety Manager. It has to be ensured that the lock of the shielding is closed and secured, so that no unshielded radiation can exit. Make sure the shielding is not modified or damaged.

Vibrations

Constant vibrations can loosen the lead in the shielding and grind up lead in extreme cases. In this case, the shielding effect and the function of the shielding are no longer guaranteed. In the worst case, the radioactive substance may leak out. Also, constant vibrations can loosen the source holder or the source, which also would impair both the function and the shielding effect.

A corrosive atmosphere requires an additional protective covering made from a suitable material, such as stainless steel sheet, or the shielding itself must be made from a suitable stainless steel. Corresponding versions are available on request from BERTHOLD TECHNOLOGIES.

NOTICE

Depending on the operation conditions, the function check has to be repeated at appropriate intervals, at least once a year.
10.2.2 Radiation Exposure during Installation of the Shielding

The shieldings of measuring systems are usually designed such that the limit of the control area is in a given distance (in most cases less than one meter) around the shielding, and it does not matter whether point or rod sources are being used and how high their activity is. A simplified calculation of the radiation exposure during installation of the shielding is possible with sufficient accuracy using the dose rate data printed on the type plate, measured in 1 m distance from the shielding. The radiation exposure $D$ can be calculated according to the following formula:

$$D = DR \times t \times 4$$

$D$ = accumulated dose during assembly in Sv  
$DR$ = dose rate on the type plate of the shielding in $\mu$Sv/h  
$t$ = time needed for the installation with shielding in h

If the work process is prepared well, you may expect a working time of less than 20 minutes to perform work such as installation of the shielding or operating the shutter.

**Calculation example**

$DR = 3\mu$Sv  
$t = 20\text{min} \times \frac{1}{3}\text{h} = \frac{1}{3}h$  
$D = 3 \times \frac{1}{3} \times 4 = 4\mu$Sv/h

If we compare this dose with the permissible annual dose of 1 mSv for persons who are not exposed to radiation on their job, this work may be carried out 250 times per year by one and the same person.
10.2.3 Radiation Dose Calculations

When preparing work on radiometric measuring systems, it is important to pre-calculate the radiation exposure to be expected, since this has consequences on the required safety precautions.

The expected radiation exposure can be calculated quite easily and with sufficient accuracy, provided you know the isotope and the activity of the source used. You can take this information from the source documentation, or from the type label on the shielding.

The radiation exposure to be expected for a shielded source is calculated as follows:

$$Dose\ D = \frac{A \times k \times T}{r^2 \times s}$$

A is the activity of the source and k the respective specific Gamma radiation constant (see table below). The distance from the measuring point to the source is r and the duration of stay at this point is T. s is the shielding factor of the shielding used, which is indicated on the information sheet of the shielding or which can be calculated. It is listed in the shielding brochure or can be calculated. s = 1 when calculating the dose rate for work with an unshielded source.

<table>
<thead>
<tr>
<th>Nuclide</th>
<th>k</th>
<th>Dimensions</th>

<tr>
<td>Co-60</td>
<td>0.35</td>
<td>μSv x m²/h x MBq</td>
</tr>
<tr>
<td>Cs-137</td>
<td>0.09</td>
<td></td>
</tr>
</tbody>
</table>

**Calculation example**

Calculate the dose in a distance of 50 cm from a Co-60 source with an activity of 350 MBq and a time of 30 minutes. The source is installed in a shielding with a shielding factor of 30:

$$Dose\ D = \frac{350\ MBq \times 0.35\ μSv \times m^2 \times 0.5h}{(0.5m)^2 \times h \times MBq \times 30} = 8.2\ μSv$$
10.3 Testing the Shutter Mechanism

The Radiation Protection Ordinance requires that regular functional testing and maintenance are carried out on the shielding and the inspection is documented. In establishing the testing interval for periodic functional testing and maintenance of the source shielding, the ambient and operating conditions of the measuring device, the legal regulations and the permit conditions must be considered. The functional checks and maintenance have to be carried out, however, at least once a year.

The functional test is to ensure that the locking mechanism is working properly. It must be ensured that:

- the closure moves easily and freely
- the locking mechanism does not get jammed at any point in the range of rotation
- the beam path can be closed completely

If you notice a failure or you have doubts, please contact the BERTHOLD TECHNOLOGIES service department.
10.4 Safety Measures

When designing the installation of radiometric measuring systems, the possibility that a fire breaks out must be considered. Flammable substances must not be stored in the proximity of radioactive substances. They should be covered and protected properly to prevent a possible spreading of the fire to the radioactive sources. It is mandatory to coordinate all preventive measures against fire with the local authorities, primarily with the fire department, which must be informed about the type, scope and place of application of the radioactive substances used, in order to be prepared in the event of fire.

When devising alarm plans, possible special features of the radiometric measuring system have to be mentioned; the Radiation Safety Manager to be notified in the event of an emergency has to be included in those plans as well, and also the address and phone number of the regulatory authority.

10.5 Protection against Theft

Radioactive substances or facilities containing radioactive substances must be secured against unauthorized use. Fixed installations are, by their nature, protected against unauthorized use.

If facilities working with radiometric measuring systems are taken out of service for a longer or indefinite period of time, the radioactive sources together with their shieldings should be dismantled and secured until the facility is taken into operation again.

Portable measuring systems, on the other hand, have to be protected by keeping them under constant supervision, or, if they are not in operation, by keeping them in a locked room or container which can be guarded against unauthorized access.

This is especially true for low activity test sources which are used, for example, to check the function of dose rate measuring instruments.

In the event that radioactive substances are lost, the Radiation Safety Manager and the regulatory authority have to be notified immediately.

In case of theft, the police must be informed as well.
10.6 Accidents, Loss, Damage, Fire, Theft

Remember the principles of health and safety in such situations: Time, distance, and shielding (see also page 1-115). In case of one of the above situations:

- Limit access to the area
- Report the incident to the authorities.
- Inform BERTHOLD TECHNOLOGIES.

Proper handling and disposal of possibly leaking radioactive sources or contaminated parts of the equipment must be coordinated with the supervisory authority.

10.6.1 Malfunctions and Accidents

The Radiation Protection Ordinance defines malfunction as an event which for safety reasons prohibits continuation of the operation of the facility.

**Malfunction**

Malfunction means, that a device necessary to guarantee safe operation of the facility, e.g. the seal of the active radiation beam of the shielding, no longer functions properly.

**Accident**

An accident is an event which could expose persons to a radiation dose which exceeds the permissible limits, or could cause contamination by radioactive substances.

In terms of safety, malfunctions and accidents are very serious events and appropriate steps must be taken immediately to prevent hazards to persons as well as facilities, or to reduce them as much as possible.

It is therefore important that the personnel is aware of preventive measures and is prepared for possible accidents or malfunctions of the facilities, so that dangerous consequences can be ruled out as far as possible by a proper reaction of the personnel.

In any case, the Radiation Safety Manager who checks the situation at site and takes all necessary steps to prevent unnecessary radiation exposure of the personnel must be notified immediately.

The Radiation Safety Manager will then take appropriate measures and will inform the official authority concerned, and, if necessary, get further information from the manufacturer.

**IMPORTANT**

The recovery of shieldings and sources after incidents and accidents may only be carried out in accordance with the instructions by the authorities.
The necessary steps should be taken in the following order:

- Locate source.
- Check function of shielding.
- Check effectiveness of shielding by measuring the dose rate.
- Guard and mark controlled areas.
- Secure source and shielding.
- Document the incident and assess possible radiation exposure of personnel.

In case the source capsule is damaged, the following points have to be considered:

- Avoid contamination.
- Handle source with tools (e.g. pincers or tweezers) and put both (source and tool) in a plastic bag.
- Stay behind auxiliary shielding (e.g. concrete, steel, or lead plate).
- Check if vicinity is free of contamination.
- Secure radioactive waste properly (deposit at governmental collection site or return to manufacturer).

If the source is leaking and the dose rate might possibly be exceeded, the regulatory authority (e.g. trade board) has to be notified immediately.

In case of an accident or malfunction or any other event which affects the safety, the regulatory authority has to be informed and also, if necessary, the authority in charge of public safety. Please contact BERTHOLD TECHNOLOGIES if you need any further information.
10.7 Shielding and Source

Shieldings do not include any wearing parts or mechanically moving parts that under normal operating conditions require maintenance. For safety reasons, however, it should be possible any time to lock the useful beam. A functional check has to be performed in appropriate intervals of max. one year (see chapter 10.3). The Radiation Safety Manager has to be informed immediately if any faults on the shielding or a sluggish locking mechanism are detected. If the problem cannot be solved simply by cleaning, you have to stop working with the system until it has been repaired.

As long as the shielding does not show any significant mechanical damage or strong corrosion, the built-in source will be protected. Please observe the radiation protection guidelines when checking or replacing the source.

The radioactive sources used and the function area of the measuring system typically permit a service life of more than 10 years. The useful life of radioactive sources should be based on the period of use recommended in the leak test certificate. A source may have to be replaced earlier if the statistical variations which increase in the course of time become intolerably high and any compensation by increasing the time constant is not acceptable any more, e.g. for control-engineering reasons.

**IMPORTANT**

Empty calibration has to be performed any time a source is replaced!

For information on the design of source and shielding please refer to the technical documentation and the identity plate (Fig. 10-1).

---

**Fig. 10-1 Identity plate**

1. Source number
2. Isotope
3. Source manufacture date
4. Shielding material
5. Type of shielding
6. Shielding manufacturer
7. Dose rate in 1 m distance
8. Effective shielding thickness
9. Activity
If the source has to be renewed, you have to include the source number of the original source in your new order. This number consists of three digits, for example:

1234 - 11 - 94

The first group is a consecutive number, the second group identifies the month (here: November) and the third the year the source was manufactured (here: 1994). It is included on the identity plate of the shielding and also on the leak test certificate that comes with every source.

10.8 Leak Test

Depending on the stipulations of the regulatory authority responsible for the sources employed in their territory, regularly recurring leak tests have to be carried out. These tests have to be carried out by approved experts, or in consultation with the regulatory authority, by the manufacturer. The appropriate documents on the source have to be provided in order to carry out this test.

10.8.1 Required Documents

- Inventory of the sources to be tested with information on the previous leak tests
- Source certificate including the following information:
  - Nuclide, activity, purchase date, physical-chemical form
  - Description of capsule and type of sealing
  - Resistance against mechanical and thermal influences or classification of the source design
- Information on location, intended use as well as on the typical operational maximum mechanical and thermal stress.
- If the sources are installed in an appliance, a drawing has to be enclosed which clearly shows the position of the source and of all parts that are essential for its protection against external influences. Proposals for the best test method should be available, e.g. through information on alternative test areas and, if necessary, the required manipulations, how the test can be carried out without adversely affecting the workability of the system or appliance.
- Certificate on an acceptance test by the manufacturer.
Alternative test areas

For point source shieldings LB 744X

Fig. 10-2 Alternative test area on point source shieldings:

Turn lever to horizontal position for inspection.
The alternative test area is the head of the visible edge of the source holder. If the cover is also accessible then you have to wipe there as well.
Source Replacement

**IMPORTANT**

Radioactive sources may be replaced only by a competent firm that has a service license to handle radioactive materials.

### 11.1 Radiation Exposure during Source Replacement

It is important to calculate the possible radiation exposure even before mounting or dismantling rod sources. An exact calculation is possible using the equation described in chapter 10.2.3.

The anticipated working hours should be split up in work in the direct vicinity of the shielding during mounting and dismantling the source holders and work with the unshielded source while fixing and dismantling the source and the source holder. The dose obtained while working in the vicinity of the shielding and the dose obtained while working with the unshielded source have to be calculated separately and added up.

A rather simplified estimation is possible, provided the work is prepared well. Based on the assumptions of a mean distance of 0.5 m for the whole body radiation and the time you are working with the unshielded source of 6 minutes (= 1/10 hour), the radiation exposure can be calculated for different activities (A) as follows:

- Dose $D = A \times 0.15$ for Co-60
- Dose $D = A \times 0.04$ for Cs-137

Enter the activity in MBq; the dose is calculated in μSv.

For multi-part rod sources, the estimated radiation exposure has to be multiplied with the number of source parts.

**IMPORTANT**

Using a pocket dosimeter with direct reading, measure the accurate radiation exposure during this work, even if the radiation exposure lies below the detection limit of dosimeters.
Calculation example

A single part rod source with an activity of 400 MBq (approx. 11 mCi) has to be replaced. Using the above assumptions concerning distance and time and the above equation, we get the following result:

\[ D = 400 \times 0.15 = 60 \mu Sv \]

The radiation exposure in the vicinity of the shielding was previously calculated to be 10 \( \mu \)Sv. The total radiation exposure including mounting and dismantling can then be estimated as being 70 \( \mu \)Sv for a single part source.

If the above assumptions do not apply, the calculations have to be corrected accordingly. Actually, it can only be another working time which has a proportional effect on the result of the calculated dose rate.
11.2 Point Source Replacement

In this chapter we will describe how to replace point sources on the following shieldings:
- LB 7440
- LB 7442
- LB 7444
- LB 7445
- LB 7446

The exchange of radioactive sources must be performed in accordance with applicable regulations under the supervision of the Radiation Safety Officer.

Health hazards due to radiation!

When replacing a source, you have to work with the unshielded source for a short time. An increased dose of radiation is harmful to health.

You have to carry a pocket dosimeter during work to measure the personal dose and to document the actual radiation exposure. Moreover, work has to be coordinated with the competent Radiation Safety Manager.

For Germany you have to keep in mind:
Source replacement by the customer is possible only if:
1) the appropriate technical qualification is guaranteed
2) the work to be done to replace the source has been approved explicitly by the regulatory authority. Your "License to Handle Radioactive Substances" states whether you are in possession of such a license.

Point sources have to be fixed on source holders which are then screwed into the shielding, positioning the source in the center of the shielding.

Prerequisite for this work is detailed knowledge of the design of the shielding; appropriate drawings must therefore be available.
Preparation

All necessary work has to be prepared well so that it can be carried out quickly to keep exposure to the unshielded source to a minimum. Using a drawing of the shielding, you should plan the best procedure and have the following tools handy:

- Allen keys in the required sizes.
- 2 pairs of pliers to take hold of source and source holder (e.g. a pair of combination pliers or multigrip pliers).

Cordon off an area consistent with the activity of the source. Prevent persons from approaching.

If sufficient space is available, the source can be replaced in the shielding installed at the measuring site. Move the new source in its transport shielding close to the installation site.

Prepare a suitable, clean space, if possible with an auxiliary shielding (shielding vessel, lead bricks, concrete stones, etc.) and place the source holder and the source there on a piece of paper to protect it against dirt.

Depending on the construction, you either have to open the lock on the shielding and turn the lever to center position between ON and OFF until the hexagon head bolt of the source holders becomes visible, or remove the locking plate, so that you can unscrew the source holder.

Source Replacement Procedure

1. Open the lock (2) of the shielding (1).
2. If necessary, pull out the locking screw (5) from the lever.
3. Pull the knob (3) and turn the lever (4) by 90° to the right to the center position between OPEN and CLOSED.

Now the hex screw head of the source holder is visible.

![Fig. 11-1  Point source shielding, beam path closed](image-url)
Health hazards due to radiation!

Do not remove the source from the shielding!

Do not touch the source to prevent a high partial body dose. Touch the source only with a tool that allows you to hold the source easily and safely. Keep the source far away from your body and set it down behind an auxiliary shielding.

- Screw the source holder (6) together with the source (7) using a socket wrench (size 12 mm).

- Unscrew the source from the source holder using a socket wrench (size 10 mm). Hold the source holder using a second socket wrench (size 12 mm).

**IMPORTANT**

*For this work, you should use the shielding housing as auxiliary shielding between source and body.*

- Take hold of the source using a pair of pliers and immediately put it into the transport shielding or another shielding.

**IMPORTANT**

*Make sure the source is not mixed up with the new or another source.*

- If necessary, clean and grease the thread on the source holder and the shielding.
Install new source

► Using a pair of pliers, take the new source out of the transport shielding and firmly fix it onto the source holder together with the locking washer (torque: 3.5Nm).

► Put the source holder with the source again into the shielding and fix it using the socket wrench (torque: 44Nm).

► Check the proper ON/OFF function.

► Carefully close the transport shielding again, after you have put the old source into the transport shielding.

Replace the type label

► Replace the type label on the shielding or attach the new source number.

► Calibrate the system new (see Volume 3, "Operation with HART® Communicator")

IMPORTANT
The special regulations regarding labeling and transport of the shielding back to the manufacturer have to be observed. If in doubt, please contact BERTHOLD TECHNOLOGIES's Source Transport Manager.

This completes the point source replacement.
Source Disposal

In general, each country has a collection site for radioactive material.

However, if you would like to return radioactive material to us for disposal, the international regulations, ADR and GGVSE, for transport, labeling and dose rates of the radioactive material have to be complied with, as well as the regulations of each country. It is the full responsibility of the sender to make sure these regulations are complied with.

Please keep in mind:

- Dose rate on the surface of the packing: <2000µSv/h.
- Dose rate in a distance of 1 m from the surface of the packing: <100µSv/h.
- Attach the UN number with the symbol for dangerous cargo on each package.
- Shipping documents with correct description of the contents and accident procedures sheet in conformance with the ADR regulations are required.
- Packaging must comply with the valid ADR regulations.

For all questions on source transport or source return please contact our sales force, or our representative.

**IMPORTANT**

*In many countries the transport of radioactive materials is subject to approval by the authorities. The source may be returned only after prior order confirmation and release confirmation by BERTHOLD TECHNOLOGIES.*
Please keep in mind:

- Radioactive materials and their shieldings may not be damaged in any way and must have a valid seal test certificate. The seal test certificate may not be older than six months at the time of arrival in Germany. An exception is possible if a PTB certificate is available which confirms that the validity of the test dates has been extended.

- If you plan to return radioactive sources with isotope Am-241 or Cm-244, you have to include the Special Form certificate.

- It is indispensable that radioactive material that is returned to us is adequately labeled with your name and address. If you have received a quotation from us, please include our quotation number as well.

- Radioactive material can be returned only after you have received permission from BERTHOLD TECHNOLOGIES. We would be happy to send you a quotation on the costs to be expected for returning a source.

- BERTHOLD TECHNOLOGIES has to be informed in advance about the return transport. Radioactive material that is shipped to BERTHOLD TECHNOLOGIES without prior notice will not be accepted by BERTHOLD TECHNOLOGIES. Any warehouse expenses will be charged to the supplier.

- The source return declaration and the seal test certificate have to be sent to BERTHOLD TECHNOLOGIES together with your order documents. The form for the source return declaration is available from BERTHOLD TECHNOLOGIES on request.
Notes:
Subject to change in the course of further technical development.
Volume 2 Installing SENSseries
System Description

1.1 Measuring System

1.1.1 Basic measuring configuration

The measuring system SENSseries LB 480 is a detector which, depending on its design, can be used for different measurement tasks:

- Level measurement
- Monitoring limit values
- Density measurement

The measuring system SENSseries LB 480 comes in the following versions:

- Point detector CrystalSENS (NaI 50/50)
- Point detector SuperSENS (scintillator 150/150)
- Rod detector UniSENS (length 0.5 to 2m in 50cm increments)
- Rod detector TowerSENS (length 3 to 8m in 1m increments)

The measuring system utilizes the radiometric measuring method, i.e. the absorption of Gamma radiation passing through the product being measured. In order to obtain an optimum measuring effect at minimal source activity, the ideal measuring geometry is calculated for each measuring site and the source is designed accordingly.

The measuring system SENSseries LB 480 is a compact detector, including the required components scintillation counters, power supply and the entire evaluation electronics, in one device.
1. System Description Volume 2

1.1.2 Detector communication

**Communication with the PCS**

The communication with display, evaluation and control devices takes place via a 2-wire HART® current interface with modulated digital current signal (FSK-modulation of the current signals according to the Standard Bell-202).

The level data are supplied as isolated 4-20mA current signal to the process control system.

**Configuration and monitoring**

Configuration, parameter setting and calibration of the detectors, as well as the output and display of the digital units of measure are carried out either:

- via a hand-held terminal, e.g. the 375 Field Communicator by Emerson Process Management GmbH & Co. OHG, or
- via PC and a suitable user interface for the detector, e.g. the SIMATIC PDM software.

The *Volume 3* describes the *Operation with HART® Communicator.*

---

1. PCS = process control system
1.1.3 Measuring Geometries

The hardware and software of the measuring system SENSseries LB 480 allow for an easy adaptation of the system to different measuring geometries and measuring tasks. Therefore, the settings and parameters of the measuring device have to be defined with care during commissioning for the particular measuring task.

Commissioning log

Important parameters may not be changed during operation. The system must be taken into operation and settings changed only by persons who know how to work with the device. Therefore, all users should read these User’s Manual carefully. BERTHOLD TECHNOLOGIES, therefore, recommends documenting all settings in a setup protocol.

Project planning

The best system configuration is selected for each measuring task in the planning stage. Therefore, the specific project documentation has to be observed and followed.
1.2 **SENSseries Hardware**

1.2.1 **Detector**

The measuring system SENSseries LB 480 comprises one detector and the evaluation unit, both accommodated in a sturdy stainless steel housing.

<table>

</tr>
</tbody>
</table>

*Fig. 1-2  Design of the SENSseries LB 480*
Evaluation electronics

Control and processing of the signals are carried out by the evaluation electronics. The 4-20 mA measuring signal is passed through a 2-wire cable to the PCS (terminals 15 and 16).

Detector communication

The measuring system SENSseries LB 480 uses the HART® protocol for communication. Configuration, parameter setting and calibration of the detectors, as well as the output and display of the digital units of measure are carried out either:

- via a hand-held terminal, e.g. the 375 Field Communicator by Emerson Process Management GmbH & Co. OHG, or
- via PC with FDT frame application or
- via PC and the SIMATIC PDM software.

Access to electronics

At the top, the detector is closed by a detachable housing cover which can be removed by unscrewing the Allen screws.

Decay compensation

For automatic decay compensation, the detector is equipped with a capacitor-buffered real-time clock. The capacitor buffers the real-time clock for about one week. If the buffering is lost, the real-time clock starts with the last saved date the detector was supplied with power. A message informs you that the date has to be updated.
1.2.2 Sources

Sources are not part of the SENSseries LB 480 measuring system. They can be purchased separately through BERTHOLD TECHNOLOGIES together with the respective shieldings and holding devices.

Radioactive sources for industrial applications are always "encapsulated radioactive substances" which are tightly welded into a sturdy capsule made of titan or stainless steel, so that the radioactive substance cannot leak out. Contamination is therefore ruled out. Moreover, any activation of the product being measured by the sources used is not possible for physical reasons.

The following radiation sources are used for measurement:

- Co-60 emits Gamma radiation with an energy of 1.17 or 1.33 MeV. It is available as rod or point-shaped source. The influence of interferences due to gas density fluctuations and varying wall deposits is lower than with Cs-137. The half-life period of Co-60 is 5.27 years.

- Cs-137 emits Gamma radiation with an energy of 0.66 MeV. Typically, it is delivered as a point-shaped source, occasionally as a rod-shaped source. The half-life period of Cs-137 is about 30 years.
1.3 Measuring Principle

The principle of measurement is the irradiation method, utilizing the physical law of the absorption of radiation passing through matter. The resulting measuring effect is the ratio $I/I_0$ between the unattenuated radiation $I_0$ and the radiation $I$ attenuated by the product being measured.

The mathematical correlation is as follows:

$$I = I_0 \times e^{-\mu \times \rho \times d}$$

The equation shows that with a given source and the respective mass attenuation coefficient $\mu$ the measuring effect is dependent only on the product density $\rho$ and the measuring path $d$.

Since the measuring path is constant and possible product density changes at a certain measuring path due to exponential reasons do not have any effect any more, this measuring method is not affected by any chemical and virtually no physical properties of the product being measured. For this reason, the radiometric measuring principle ensures high reliability and low maintenance.

![Fig. 1-4 Measuring principle](image)
1.4 Measuring Arrangements

To be able to cover a certain measuring range continuously, a measuring arrangement must be realized where the dimensions of source and detector form a geometry, which covers a measuring field of equal size. The different options that are available will be described below.

Which of these arrangements is chosen depends on the size of the measuring range and on the measuring geometry resulting from the measuring task. Moreover, constructional circumstances and customer-specific requirements may have an effect on the device selection.

The respective selections are made during the planning stage and must be observed during assembly and commissioning.

Point source / Point detector arrangement for limit switches

The arrangement shown in Fig. 1-5 is used for monitoring limit values, for example to avoid overflowing when filling a container consisting of point source and point detector.

Ambient temperature
for use in hazardous areas

General ambient conditions for explosion protection to CSA

Pollution Degree: 2
Installation Category: III
Altitude: up to 4000 m
Humidity: 90% or less

The approvals listed on the type plate of the each detector are valid.

IP protection type

according to IEC 60529: IP66 and IP68
according to ISO 20653: IP69K
according to NEMA Standard Publ. 250: 4X and 6

Vibration, mechanical shock

Vibration: 1.9g
mechanical shock: 30g
according to DIN EN 60068-2-6 and 60068-2-27

EMC

Interference emission to EN 61326-1, Equipment Class A
Resistance to interference to EN 61326-1, NAMUR NE21 and EN 61326-3-1 (SIL)

Housing

Material stainless steel 1.4301/304; other stainless steels on request.

Weight

see Volume 2, chapter 5.

Water cooling

Stainless steel 1.4301/304; maximum 6 bar, hose connection R1/4" or 10 mm dia.
**Current output**

HART current output 4 ... 20mA, floating passive or active (Source or Sink mode)

Resolution better 6μA

Impedance range active: 120Ohm to 500Ohm

Passive impedance range: up to 250 ohms at 12V, up to 500 ohms at 24V.

For safe HART® communication you need at least 250 ohms.

The maximum cable length of the HART® loop depends on the connected impedance as well as on the capacity and inductivity of the cable.

Max. cable length with BERTHOLD cable # 32024:

- 3300 m at 120 ohms
- 1600m at 250 ohms
- 800m at 500 ohms

The current output itself is monitored continuously and, in case of malfunction, signals 24 mA constantly via a redundant current path.

The digital HART® communication remains in effect even on the redundant current path.

High voltage generation

Voltage range of control 300V to 1300V (error message below 300V and above 1300V)

Voltage range external setting 300V to 1300V

Sensitivity changes due to temperature variation or due to ageing are automatically compensated for by an automatic high voltage control.

Counter

Rate max. 1,000,000 cps

Automatic decay compensation

For Cs-137, Co-60 and a universally configurable isotope

Digital output (not Ex)

Open Collector; max. 100mA at 5 to 35VDC; Rmax 10kOhm; max. 2V voltage drop; at inductive load a freewheeling diode is required

The output can be used either for:
- Error signal
- Stop signal
- Max. alarm
- Min. alarm
- Detector temperature
- Interfering radiation

For intrinsically safe signal output see Volume 1, chapter 5, “Explosion Protection”.

RS-485

Software updates

Detector temperature sensor

Two independent temperature sensors

Measurement deviation:
-25°C to 100°C: ±2K
-55°C to 125°C: ±3K

Connection to PCS

Via current interface 4–20mA with optional HART® protocol according to Standard BELL-202 FSK.
Pt100
- measurable temperature range -30°C ... 180°C
- monitored temp limits
- Accuracy: +/-0.2°C
- maximum connectable cable length: 30m
1.6 Detector Codes

The detector codes are used for automatically adjusting the operating point of the high voltage and have already been set by the manufacturer. They only have to be checked or adapted when the electronics has been exchanged.

(LK = License Key)
Installation

Please pay attention to:

- the national safety and accident prevention regulations
- the national assembly and installation directions (for example, EN 60079)
- the generally accepted engineering rules
- the information on transport, assembly, operation, service, maintenance in this User’s Manual
- the safety instructions and information in this User’s Manual and the enclosed technical drawings and wiring diagrams
- the parameters, limit values and the information on operating and ambient conditions on the type labels and in the data sheets
- the labels on the device

Health hazards due to radiation!
Radiometric measurement devices use radioactive materials.

Danger due to radioactivity may occur if persons are exposed to radiation as a result of improper working with the measuring system.

Only persons who are trained in the handling of radioactive materials and possess the necessary know-how and skills are allowed to work with these measuring systems, see Volume 1, chapter 3, “Qualification of Personnel”, page 1-19. Construction site personnel with experience in transporting heavy components may also be commissioned to carry out the installation. This construction site personnel, however, has to be guided by qualified persons; the Radiation Safety Officer has to be consulted for transportation and installation of the source.

Careful conformance to these regulations ensures that no hazard exists for persons using the devices.

Please be sure to comply with the Radiation Protection Guidelines applicable in your country and observe the Radiation Protection Instructions in chapter 10, page 1-115.
Storing the shieldings

The shielding with the radioactive source is delivered in a box in compliance with the regulations concerning the transportation of radioactive substances.

**WARNING**

Risk of injury!

The weight of the source shielding may be up to several 100kg, depending on the version.

Make sure that the mechanical stability of the mounting devices matches the weight of the shielding and that the operating staff is wearing hard hats and safety shoes whenever doing any work on the shielding.

Take the shielding out of the box just prior to installation. Up to that time, store the shielding with the radioactive source in a location that is guarded against unauthorized access, see chapter 2.1.4 on page 2-158.

Detector

Damaged cable glands must be replaced immediately. Under no circumstances should the detector be operated with damaged cable glands. If moisture has penetrated, you have to dry the terminal compartment.

Detectors which are used in hazardous areas must not be put into operation again following a mechanical shock or drop, as the explosion protection is no longer guaranteed. If this happens, the detector must be examined by a person authorized by BERTHOLD TECHNOLOGIES. If this is not possible, you have to replace the entire detector or return it to the manufacturer for inspection.

Corrosion resistance

The housing of the detector is made of stainless steel 1.4301 (304) and is therefore well protected from corrosion. The protection provided by stainless steels consists of a passive oxide layer on the surface, which is formed by oxidation with oxygen. However, if the surface gets damaged by unalloyed steel and particles of the unalloyed steel remain on the surface (ferrous contamination), then the surface may corrode at this contact point. Make sure, therefore, that neither during installation nor during operation other metal parts made of non-alloyed steel come into contact with the housing surface of the detector.

Mounting position

Size and position of the measuring range to be covered are determined in the projection phase for the measuring site and defined by drawings, sketches or details in writing. For assembly, these specifications have to be observed closely, since deviations may cause malfunctions of the measuring system.

Using the drawings of the shielding and taking into account the circumstances at the measuring site, carefully install the mounting brackets and fixtures.
2.1 Transport to the Installation Site

Risk of injury!
- Never step under hovering loads while unloading heavy system parts!
- Only use tested lifting equipment matching the transport weights.
- Maintain adequate safety margin.
- Wear hard hat and safety shoes.

Transportation may also be carried out by construction site personnel with experience in transporting heavy components. However, this construction site personnel has to be guided by authorized persons; the Radiation Safety Officer has to be consulted for transportation of the source.

2.1.1 Transporting Detector and Evaluation Unit

Risk of damage!
System parts may get damaged during transport.
Transport the detector and evaluation unit in the original packaging and protect the parts from vibrations.

2.1.2 Transporting Shielding with Source

Please observe the Radiation Protection Guidelines. Radioactive substances may be transported on public traffic routes only by persons in possession of the proper transport license!

Health hazards due to radiation!
A source may be transported only in its shielding. The shielding must be closed during transportation and installation.

The shielding with the source inside can be lifted onto a palette by a fork-lift and transported to its destination. If the system parts are provided with eyebolts for transportation, they have to be used for lifting, unless the system parts are transported in their original packaging.
2.1.3 **Temporary Storage of Sources**

The operator has to take suitable provisions for temporary storage of sources at the place of installation between the period from source delivery to the start of the installation work.

Sources will be stored in their shieldings. A source may be stored only in a lockable room which is identified accordingly. Accessible controlled areas have to be identified and, if necessary, secured.

2.1.4 **Installation Sites**

**WARNING**

Risk of injury!

Heavy system parts may fall down if not installed properly.

The bearing capacity of the vessel walls or the brackets must be suitable for installation of the source with the shielding and the detector.

Free space must be foreseen at the installation site for:

- Freedom of motion for delivery of shielding, detector and evaluation unit.
- The electrical installation of the detector.
- Servicing and repair work, to install and dismantle parts.

The fixture for the assembled system components must not transfer any vibrations to the detector or the shielding. Likewise, it has to be ruled out that too high temperatures can be transferred to the system components.

The source with shielding and the detector are horizontally installed on the designated position on the outside of the vessel and outside a possibly installed heat insulation. The exact position for your system parts is stated on the calculation documents and the technical information prepared by BERTHOLD TECHNOLOGIES.

2.1.5 **Unpacking and Cleaning System Parts**

After unpacking, compare all parts with the packing list and check if the shipment is complete and shows any sign of damage. If necessary, you may have to clean parts.

If you detect any damage, notify the forwarder and the manufacturer immediately.
2.2 Detector Protection

The detector may be damaged due to strong mechanical stress, vibrations and high temperatures.

Prevent heat transfer from the detector holder to the detector by using a suitable heat-neutralizing suspension.

2.2.1 Cooling

The ambient temperature must not exceed the values specified in the technical data (see Volume 2, chapter 1.5, page 2-147). If temperatures exceeding 50°C are expected, you have to use a detector with water cooling jacket (see page 2-165). The cooling water cycle has to remain in operation even when the detector is turned off, if the maximum operating temperature is likely to be exceeded.

Risk of overheating!

A failure of the water cooling or insufficient flow can overheat and thus destroy the detector.

The maximum ambient temperatures are listed in the technical data in chapter 1.5, page 2-147. In addition:

- To prevent freezing, the water cooling system must be drained.
- Polluted cooling water may clog the water cooling system, which may result in the detector getting overheated and destroyed. It is therefore essential to use clean cooling water. 
- The water pressure in the cooling jacket must not exceed 6 bar.

Water cooling in Ex-areas

The information in the Safety Manual regarding the ambient temperature for explosion protection also apply to the operation of a water cooling on detectors that are used in hazardous areas.

Detector temperature monitoring

The detector includes an internal temperature measurement which can be used to trigger a pre-alarm if higher temperatures are measured. The temperature switch point is adjustable. The alarm can be picked up at the digital output (see Volume 3, chapter 2.27). If you operate the water cooling so that the temperature at the detector remains below 40°C, you could switch off the detector on exceeding a temperature limit of e.g. 50°C prematurely to protect the detector against overtemperature.
Cooling water curves

The required amount of cooling water is dependent on the possible heat transmission, the cooling water temperature and the detector type. You find the cooling water curves and further information in the technical specifications on page 2-193.

Connecting the water cooling

Water is always supplied from the bottom to prevent air pockets that can drastically reduce the cooling effect. Therefore, the detector has to be aligned so that the water exits at the highest point. See illustration on page 2-165.

2.2.2 Sun Protection

If the detector is installed outdoors, it should be protected against exposure to direct sunlight by a weather protection roof.

2.2.3 Heavy-Duty Environments

When selecting the installation site, keep in mind that the detector should not be affected by mechanical stress or heavy vibrations, in order not to restrict its service life. If the measuring system is used in a heavy-duty environment, the detector and the shielding should be provided with an additional protective cover.

2.2.4 Precautions against Vibrations

Excessive vibrations or shocks on the detector shorten the service life. Mount the detector on a vibration-free support; you may also dampen possibly occurring vibrations or shocks using appropriate vibration absorbers.

2.2.5 Magnetic Fields

The detector is provided with an internal shielding that protects the photomultiplier against magnetic fields. Nevertheless, strong magnetic fields in close proximity to the detector may impair its function. In this case, the detector can be protected by an additional thick-walled steel tube, or the measuring point has to be relocated to another suitable position. In these cases BERTHOLD TECHNOLOGIES would be happy to help you.
2.2.6 Cleaning

Make sure not to damage the cable glands and the type plates by cleaning measures. The detector may be cleaned with water or gasoline. Remove coarse deposits with a wire brush. Grinding, filing or chipping away at deposits with the hammer is not permitted.
2.3 **CrystalSENS (Point Detector)**

Make sure that

- the detector or the source fixtures do not obstruct the beam path.
- there are no pipes, flanges, stirrers or other installations in the beam path.

Only installations that have already been taken into account in planning the measurement configuration are permitted. Otherwise, the curve is no longer linear; there may even be sections in the measurement range where the measured values do not change.

---

**IMPORTANT**

*When installing the CrystalSENS, please pay attention to the correct alignment relative to the source (see also page 2-193). The lateral opening (beam window) in the collimator releases the sensitive area of the detector and must be directed at the source.*

---

![Diagram of CrystalSENS components](image)

**Fig. 2-2 CrystalSENS**
The CrystalISENS is installed on the container using a fixture that is provided by the customer. The distance to the surface of the vessel or the surface of a thermal insulation should be about 100 mm. Clamps (see chapter 2.3.1) or an installation kit (see chapter 2.3.2) are used for installation of the detector on a bracket.

Fig. 2-3 Installing the CrystalISENS

If the bracket cannot be mounted on the container, then it has to be mounted on a support in the vicinity. Fig. 2-4 shows three further alternative proposals (A, B, C) to mount the detector.

Fig. 2-4 Alternative installations

The technical drawings for CrystalISENS and its accessories can be found in chapter 5 "Technical Information" on page 2-193.
2.3.1 Installation Procedure using Fastening Clamps

Stainless steel clamps are available for the installation of the detector.

<table>
<thead>
<tr>
<th>Clamps for CrystalSENS without water cooling</th>
<th>Clamps for CrystalSENS with Water cooling</th>
</tr>
</thead>
<tbody>
<tr>
<td>ID No. 31346 (1 set = 2 clamps)</td>
<td>ID No. 31347 (1 set = 2 clamps)</td>
</tr>
</tbody>
</table>

1. Make a suitable bracket for the container (see page 2-197).
2. Mount the bracket either directly on the container or on a stable support.
3. Mount the detector with the clamps on the bracket (see chapter 5.1, “TI LB 480 Level Switch”).

2.3.2 Installation Procedure with Mounting Kit

A robust stainless steel holder is available instead of the clamps.

The holder consists of an angle on which two clamps are already mounted. You can bolt or weld the holder on a bracket.

For detectors without water cooling system you have to use the plastic rings shown with dashed lines in the drawing to the left for installation. They compensate for the difference in diameter between detectors with or without water cooling. Thus, the same bracket can be used for detectors with and without water cooling.

All metal parts of this holder are made of stainless steel. You find the technical drawing with dimensions in chapter 5 on page 2-193.

<table>
<thead>
<tr>
<th>Mounting Kit for CrystalSENS</th>
</tr>
</thead>
<tbody>
<tr>
<td>ID No. 39246</td>
</tr>
</tbody>
</table>

1. Make a suitable bracket for the container (see page 2-197).
2. Mount the bracket either directly on the container or on a stable support.
3. Mount the holder with the detector on the bracket.
2.4 Water cooling

If you have ordered the detector together with the water cooling, the water cooling is already mounted.

If you order the water cooling later, then you have to install it according to the following instructions.

Installing the water cooling

1. Remove the four front screws and pull the collimator from the detector.

To attach the collimator and the water cooling later to the detector again, you need four screws that are 5 mm longer than the original screws (not included).

2. Slide the cooling jacket over the detector.
3. Remove the plastic ring from the collimator by opening the screws on the side of the collimator.

![Collimator for detector](image1)

**Fig. 2-8** Collimator for detector

4. Slide the collimator over the water cooling system, so that the beam window is facing the source. Position the collimator and water cooling relative to the pitch circle of the detector. Make sure that the position of the cooling nozzle is arranged so that later you have unhindered access to the installation of the water supply.

![Detector with water cooling and collimator](image2)

**Fig. 2-9** Detector with water cooling and collimator

Please read the information on the water cooling on page 2-160.
2.5 Shielding

Shielding, source type, isotope and activity for each measurement configuration will be selected together with the customer to ensure compliance with the local dose rate limits. Co-60 or Cs-137 point sources are used which are tightly welded into a capsule made of titan or stainless steel. Therefore, no radioactive material can escape, provided the source is intact, and contaminations are ruled out.

For point source shieldings, the capsule with the source is fixed on a source holder and installed in the shielding. For rod source shieldings, a rod source is placed into the existing borehole of the shielding. The shielding matches the length of the source.

The distance from the source shieldings to the vessel surface is designed such that reaching into the beam channel with the hand is prevented (reference value approx. 20 mm). For shieldings with a rotary cylinder (vertically standing cylinder) make sure that the cylinder can be rotated on the vessel surface without friction.

Apart from a few exceptions, all shieldings are filled with lead to keep the dose rate on the surface with small construction sizes as low as possible. Therefore, the shieldings are quite heavy. The weights are listed in the technical drawings in chapter 5 on page 2-193.

For information on the design of source and shielding please refer to the technical documentation and the type plate (Fig. 2-10).

![Fig. 2-10 Type plate](image)

1 Source number
2 Isotope
3 Source manufacture date
4 Shielding material
5 Type of shielding
6 Manufacturer of the shielding
7 Dose rate in 1 m distance
8 Effective shielding thickness
9 Activity
Please observe the safety instructions in Volume 1 on page 1-115. A source may be transported only in its shielding. Keep the source shielding closed during storage, transportation and installation.

The arrangement of the sources is defined during the planning stage and entered in a drawing or defined in writing. These details must be observed carefully to ensure correct linearization data. Detailed information about the design and function of each shielding being used can also be found in the drawings, which are included in the documentation.

2.5.1 **Point Source Shielding LB744X**

![Radiation warning sign](image)

The radiation warning sign identifies the start of the controlled area, provided the controlled area is outside the shielding. If the controlled area is inside the shielding, then the radiation warning sign attached on the shielding suffices.

**CAUTION**

Increased radiation dose due to open beam channel!

A too high dose of radiation may be harmful to your health.

A source may be transported only in its shielding. The shielding must be closed during transportation and installation.

The radiation exit is cone shaped with an angle of about 10°. During installation, the shielding and thus the useful beam must be aligned such that they point exactly towards the detector.

![Point source shielding](image)
The shielding consists of a lead cylinder with source exit channel (7), surrounded by a steel coat (Fig. 2-13). The locking core (6) is firmly connected to a locking lever (4). The positions OPEN and CLOSED are protected against removal of the source by unauthorized persons by the padlock (3).

When turning the lever (4) the locking core is turned as well and the source exit channel is released in the direction of the detector. The arrow on the lever is pointing to "OPEN".

The source exit channel must be closed during transportation, during installation and while carrying out work on the vessel. The arrow on the lever is pointing to "CLOSED". In the "OPEN" and "CLOSED" position, the lever or the locking core are protected by a padlock.
Installing the shielding

Installation is possible on a console or on a flange (see page 2-197). Size and position of the measuring range to be covered are determined in the projection phase for the measuring site and defined by drawings, sketches or details in writing. For assembly, these specifications have to be observed closely, since deviations may cause malfunctions of the measuring system.

The mounting flange or mounting bracket for the shielding must take into account the angle foreseen when preparing the installation. Mounting parts such as adjustable angles allow later adjustments or modifications within certain limits.

Function failure due to damage

The detector fixture must not transfer any vibrations or heat onto the shielding; otherwise the locking mechanism may be damaged and the shielding effectiveness may be adversely affected.

Therefore, install the fixture on a vibration-free support or attenuate possible vibrations using vibration absorbers. Prevent heat transfer by using suitable insulating materials.
Electrical Installation

Installation should only be performed by a qualified electrician (competent person).

The safe operation of the detector is only guaranteed if you follow the safety instructions described in Volume 1, chapter 6.

3.1 Cable Entries

Depending on the model, the detectors are provided either with M20 (ATEX) or with ½” NPT cable entries (FM/CSA), through which the electrical cables are be installed according to regulations. Conduits or cable glands can be screwed into the cable entries. They have to be licensed for the respective type of protection and have to be installed carefully in accordance with regulations! Cables and cable conduits have to be aligned such that water cannot flow into the bushing along the cable. Also make sure that all cables that are installed are not subject to abrasion, strain or kinks.

Cable entries that are not used must have dummy plugs installed.

The shield must be connected to terminal PE. Insulate the shielding braid using a shrink tubing or other suitable insulating material.

Cable entries M20
Cable entries that are not used must have dummy plugs installed.

View with the cover removed

Power supply

Equipotential busbar provided by customer

Signal line

Fig. 3-1 Detector housing open - top view

Cable entries that are not used must have dummy plugs installed.
3.1.1 **ATEX Connection Type**

Follow the safety instructions in chapter 5, "Explosion Protection", *Volume 1.*

3.1.2 **FM/CSA Connection Type**

A stopping box (conduit seal) has to be installed on each cable entry used directly behind the detector housing.

3.1.3 **Replacing a Detector or Using it at another Measuring Point**

Detectors which are used in non-hazardous areas are not subject to the supervision and maintenance of Ex-protection experts; therefore, it is not guaranteed that, for example, for repair or assembly, the necessary care is taken which is required for the detectors in Ex-areas. The Ex-protection safety is therefore no longer guaranteed. The same applies to the intrinsic safety of detectors. Therefore:

- Detectors that are used in the non-Ex area may not be used in an Ex area.
- Intrinsically safe detectors, whose intrinsically safe signals are connected to non-intrinsically safe circuits must not be connected to intrinsically safe circuits any more.
### 3.2 Terminals

#### 3.2.1 Terminal compartment

Permissible conductor cross-section for terminals:
- with ferrules 0.5 - 1.5 mm² (AWG 21 - 16 flexible)
- without ferrule 0.5 - 2.5 mm² (AWG 21 - 14 flexible or solid)

#### 3.2.2 Terminal description

Fig. 3-2 Terminal compartment

[Diagram of terminal compartment with connections labeled]
### Signal cable with shielding

We recommend using a screened cable for the signal lines.

The screen has to be connected to the detector on the PE terminal in the terminal compartment of the detector, or better, to suitable EMC cable glands.

3.3 Connecting the Detector

If lines are already connected to the detector, keep in mind:

---

**WARNING**

Explosion hazard!

As long as the detector is supplied with power, do not open the terminal compartment cover if there is a potentially explosive atmosphere.

---

**WARNING**

Risk of fatal injury due to electric shock!

If the terminal compartment cover is open, you are at risk of getting an electric shock when you touch the terminals. Do not connect or disconnect any wires as long as the device is supplied with line voltage.

Depending on the type of detector, the detector is supplied with 110/230 V\text{AC} or 24 V\text{DC}. With the version with 110/230 V\text{AC} and with the line voltage switched, please pay attention to adequate protection against accidental contact.

Always follow the safety instructions for "Electrical Installation" on page 2-171 and if applicable for Explosion Protection on page 1-23.

---

**IMPORTANT**

Open the terminal compartment only in dry ambient conditions, never in the rain.
Moisture in the terminal compartment can both cause a short circuit with other lines or cancel the explosion protection.

---

Hereinafter, it is assumed that no cables have been connected yet. Otherwise, make sure that the detector is not live.

As the intensity of electromagnetic interference on the cables is very different in the systems, we recommend using a shielded cable. Signal cables must not be laid parallel to power lines. This is especially important for master lines and lines with high current load: Keep a minimum distance of 50 cm.

Cable shields can be placed on the terminals marked with PE. If EMC cable glands are used, the shield must be placed directly in the cable gland. Screened cables must be connected at one end to the detector. Even with a multi-detector application, put on the shield of the RS-485 connection cable on one side only.

For the following activities, use the checklists in chapter 5.8.1 on page 1-51 and chapter 5.8.2 on page 1-53 to document the accuracy and completeness of your work.

For detectors that are used in hazardous areas, the detector housing (Fig. 3-3) and thus the pressure-proof enclosure of the electronics may be opened only by the BERTHOLD TECHNOLOGIES service or by persons authorized by BERTHOLD TECHNOLOGIES.
Connecting cables

- Unscrew the housing cover (M5 and M8 Allen wrench).
- Remove the sealing plug on the bushings that you need for your cable entry.
- Install the screwed cable gland or for FM/CSA a conduit system with a conduit seal before the cable entry into the terminal compartment.

**IMPORTANT**

*In Ex-protected areas, use only cable glands that are approved for your explosion protection.*

- Pull the connection cables with the complete external insulation through the cable entry into the terminal compartment. Make sure that the cable diameter of the cable used is suitable for the screw connection.
- Make sure when installing the cables that mechanical damage to the conductor insulation from sharp edges or moving metal parts will be ruled out.
- Keep the cable length long enough to create a cable loop for strain relief before the housing inlet.
- Install the connecting cables in the terminal compartment so that
  - dirt and moisture is avoided in the terminal compartment;
  - the wires are not damaged when stripping;
  - the conductor insulation extends into the terminals when stripping;
  - the minimum bending radii permitted for the respective cross-section are not fallen below;
- Stranded leads have to be stripped 10mm, and may be introduced only when the spring-type terminal was opened by a suitable tool (screwdriver with a blade width of about 3 mm). Make sure that all wires of the stranded lead are completely trapped and no small wires project from the terminal. The insulation of the wire must extend into the terminal insertion opening.
Connect the wires according to the wiring diagram in *chapter 3.1* and *chapter 3.2* to the terminal strip of the detector. Use at least the following terminals:
- Signal output: Terminals 19 and 20
- Power supply: Terminals 2 and 3 and the PE terminal for the grounding conductor connection.

Place the cable shields on the terminals marked with PE. Place the cable shield directly inside the screw fitting, if you are using EMC screw fittings.

Make sure that the wires sit securely in the terminals.

Connect the terminal for potential equalization to the outside of the detector housing using the equipotential busbar.

With cable glands: Tighten the hexagon nuts of the cable entries so much that the tightness of the terminal compartment and the strain relief protection of the connection points are secured. The tightening torques can be found on page 1–47.

Remove any loose metal particles, dirt and traces of moisture from the terminal compartment.

Only with Ex-protection FM/CSA: When installing pipework in a hazardous area, encapsulate the conduit seal using a suitable filler.

Make sure that the cover seal is undamaged and the snap rings or Nordlock discs are placed on all the cover screws.

Close the housing carefully with the cover seal and the housing cover. To do this, put the housing cover with the sealing on the housing and tighten the Allen screws using the specified torque: depending on the version, M5 with 4 Nm or M8 with 17 Nm (standard values).

Create cable loops with the connected lines in front of the housing entrance and provide for an appropriate strain relief of the connected cables. If there is a danger that the cable may be used as a stepladder, then the cables must be installed protected, for example in conduits.

Now you may turn on the line voltage.

After completion of the work, use the plan on page 1–53 to check the terminal compartment.
Repair, Maintenance and Upkeep

**IMPORTANT**

Spare parts for detectors used in the Ex-area must be mounted solely by the BERTHOLD TECHNOLOGIES service or by persons authorized by BERTHOLD TECHNOLOGIES. If this is not possible, you must replace the entire detector or return it to the manufacturer for repair.

For devices that are NOT used in an Ex-area, the following parts may be replaced at your own risk and taking into account a loss of any existing warranty by BERTHOLD TECHNOLOGIES:

- the complete detector electronics
- the complete connection head
- the crystal at the CrystalSENS
- the multiplier (PMT)
- the multiplier crystal combination
- the detector housing

BERTHOLD TECHNOLOGIES recommends to have detectors repaired solely by the BERTHOLD TECHNOLOGIES service or by persons authorized by BERTHOLD TECHNOLOGIES.

Only original spare parts by BERTHOLD TECHNOLOGIES may be used.

Please follow the instructions in the Safety Manual (Volume 1) for every repair and the instructions in chapter 3, "Electrical Installation", page 2-171.

After every repair, maintenance or upkeep, please use the checklists on page 1-51 and page 1-53.
4.1 Safety Instructions

Observe the legal provisions that apply in your country!

Repair and maintenance work on the detectors must be performed by competent personnel, see Volume 1, chapter 3, "Qualification of Personnel", page 1-19. If in doubt, return the entire detector for repair to BERTHOLD TECHNOLOGIES.

Also note the following points:

- Repairs to electronic circuits on the board of your SENSseries detector must be carried out exclusively by the manufacturer.
- Any time you are working on electrical components, you have to observe the relevant safety regulations. Please refer to the safety instructions at the beginning of this User’s Manual. Turn off the detector and disconnect any relay contacts and all inputs and outputs.

---

**CAUTION**

Danger due to radiation!
Radiometric measurement devices use radioactive materials.

The source emits radiation through the source exit channel. There may be a danger arising from radioactivity when people are exposed to this radiation.

Always keep the source exit channel of the shielding closed during assembly work.

---

Corrosion protection

If non-alloyed steel comes into contact with a stainless steel surface, the surface can corrode at this point. Make sure, therefore, that neither during installation nor during operation other metal parts made of non-alloyed steel come into contact with the housing surface of the detector.

ESD protective measures

The electronics of this measuring system contains electrostatic highly sensitive components. We recommend that you wear an ESD wrist strap during installation or repair work. Connect this wrist strap to the ground conductor.
4.2 Replacing the Complete Detector

Reuse of detectors

Detectors that are used in the non-Ex area may not be used in an Ex area.

Intrinsically safe detectors, whose intrinsically safe signals are connected to non-intrinsically safe circuits must not be connected to intrinsically safe circuits any more.

Explanation:

Detectors which are used in non-hazardous areas are not subject to the supervision and maintenance of Ex-protection experts; therefore, it is not guaranteed that, for example, for repair or assembly, the necessary care is taken which is required for the detectors in Ex-areas. The Ex-protection safety is therefore no longer guaranteed. The same applies to the intrinsic safety of detectors.

Replacing the detector

Proceed as follows to replace the detector:

- Write down all software parameters of the installed detector.
- Disconnect the detector from power.
- Turn off any peripherals connected and all inputs and outputs.
- Unscrew the housing cover (M5 and M8 Allen wrench).
- Open wiring on digital board and on the terminals.

**Tip**

If the wires are not marked, we recommend marking the individual wires before disconnecting them.

**NOTICE**

After you have disconnected the wires and cables, reattach the housing cover with sealing immediately, so that the parts cannot be damaged during the mechanical removal.

- Dismantle the old detector from the fixture.
- Mount the new detector onto the fixture.
- Unscrew housing cover of the old detector.
- Connect the wires.
- Close the housing carefully with the housing cover. To do this, put the housing cover with the sealing on the housing and tighten the Allen screws using the specified torque: depending on the version, M5 with 4 Nm or M8 with 17 Nm (standard values).
- Turn on power.
Enter the previously documented parameters of the detector with the exception of the parameter HV-Default via the HART® Communicator or an alternative user interface.

Perform a new calibration (see Volume 3, chapter 5).

**Now the detector is ready for operation again.**
4.3 Replacing the Electronics Module

Explosion hazard!

For detectors used in the Ex-area, the electronics module must be replaced solely by the BERTHOLD TECHNOLOGIES service or by persons authorized by BERTHOLD TECHNOLOGIES. If this is not possible, you must replace the entire detector or return it to the manufacturer for repair.

**IMPORTANT**

Removal and installation of parts of the SENSseries detector should be carried out in a clean workshop environment.

The electronics module has to be dismantled if one of the following parts has to be exchanged:

- Electronics module (see page 2-183)
- Crystal-multiplier combination for CrystalSENS (see page 2-186)

The electronics in the CrystalSENS is dismantled together with the crystal-multiplier assembly. In the SuperSENS the electronics is dismantled together with the multiplier.

4.3.1 Dismantling the Electronics Module

**IMPORTANT**

Since all detector parameters are stored on the electronics module, you have to enter all the parameters again after you have exchanged the electronics. If you still have access to the detector parameters before the exchange, write them down so you can then enter them into the new electronics. Otherwise, you have to re-configure and re-calibrate the detector again. Please see the appropriate volume for instructions.

To replace the electronics module, you have to dismantle the housing overtube from the connection head.

You may carry out the activities described below only if the detector is not used in an Ex-area.

- Write down all software parameters of the installed detector.
- Disconnect the detector from the power and switch off the detector and any connected peripherals.
Risk of fatal injury due to electric shock!
If the housing is open you may come into contact with live parts if the power supply is connected.
Make sure when you open the cover that no supply voltage is applied to the terminals. Use a voltmeter.

► Unscrew the housing cover (M5 and M8 Allen wrench).
► Unscrew the six screws that connect the detector housing to the connection head (Torx T25).

Fig. 4-1   Dismantling the detector electronics

► Carefully pull out the electronics module together with the crystal-multiplier assembly.
► Remove the overtube with the multiplier (SuperSENS) or the crystal-multiplier assembly (CrystalSENS) from the electronics.
► Loosen the connecting wires between connection head and electronics.
► Remove the electronics from the connection head by opening the four stud screws on the side of the metal plate of the PCB holder.
► Now you can replace the entire electronics module.
4.3.2 Installing the Electronics Module

Reassemble the electronics module in reverse order.

- Connect the wires between connection head and electronics correctly.
- Check that the wires sit firmly in the terminals.
- Replace the O-ring that seals the housing.
- Make sure that neither moisture nor metal chips are present in the connection box.
- Carefully insert electronics module with the crystal-multiplier assembly again into the housing.
- Attach the connection head to the detector housing again. Tighten screws evenly alternating between screws.
- Close the housing carefully with the housing cover. To do this, put the housing cover with the sealing on the housing and tighten the Allen screws using the specified torque: depending on the version, M5 with 4 Nm or M8 with 17 Nm (standard values).

If you have installed a new electronics module:

- Place the supplied sticker over the number of the Dev. ID on the type plate.
- Turn on the power supply of the detector again.
- Set the software parameters again using the list you have noted down at the beginning. See also Volume 3 on page 3-221.

Separate User’s Manuals are available for user interfaces such as SIMATIC PDM or FOUNDATION™ Fieldbus.

This completes the replacement of the electronics module.
4.4 Replacing the Crystal-Multiplier Assembly (for CrystalSENS)

**Explosion hazard!**

For detectors used in the Ex-area, the crystal-multiplier assembly must be replaced solely by the BERTHOLD TECHNOLOGIES service or by persons authorized by BERTHOLD TECHNOLOGIES. If this is not possible, you must replace the entire detector or return it to the manufacturer for repair.

Replacing the crystal-multiplier assembly can cause a change in sensitivity of the detector for gamma radiation. Therefore, check the calibration after the replacement and possibly perform a new calibration.

You may carry out the activities described below only if the detector is not used in an Ex-area.

- Remove the electronics module as described on page 2-183.
- Dismantle the crystal: loosen and remove the sleeve nut on top of the overtube of the multiplier tube (PMT). Then pull the crystal off the multiplier.
- Remove the PMT overtube from the PCB holder.
- Pull the multiplier from the base of the electronics.
- Plug the new multiplier into the socket. Please observe the encoding nose.
- Install the electronics module into the detector as described on page 2-185.

**IMPORTANT**

The replacement of the multiplier requires a readjustment of detector code and HV parameters. Please read also Volume 2, chapter 1.6, "Detector Codes", page 2-151, and Volume 3, chapter 2.38, "Plateau Measurement", page 3-284.

- Check the function of the measurement. If you detect any deviations, carry out a new calibration, see Volume 3, chapter 5, on page 3-305.

Separate User’s Manuals are available for user interfaces such as SIMATIC PDM or FOUNDATION™ Fieldbus.

This completes the exchange of the crystal-multiplier assembly.
4.5 Checking the Detector

Scintillation counters do not include any wearing parts and their service life is not limited, provided they are used under normal operating conditions. Malfunctions or aging in the scintillation detector can only be caused by excessive mechanical or thermal stress.

Scintillation counters are used as detectors, since only these detector systems provide the required high sensitivity to Gamma radiation and their service life is independent of the intensity of the radiation field.

The number of light flashes per time unit is a measure of the intensity of the radiation field. The individual flashes of light are very short, so that a high resolution is obtained; this detector can be employed for high count rates.

The flashes of light are converted into electrical signals in a photomultiplier (PMT), which is optically coupled to the detector.

![Scintillation detector diagram]

*Fig. 4-2 Scintillation detector*

The point detector CrystalSENS uses a 50/50 NaI crystal as a scintillator, the SuperSENS detector uses a 150/150 scintillator.
4.5.1 Checking the NaI Point Detector (CrystalSENS)

Malfunctions of the scintillation counter are not always indicated by a missing pulse rate; it is also possible that the specific Gamma sensitivity appears to have changed or obvious instabilities are apparent. These errors can be detected only by means of a plateau check. The detectors of the SENSseries include a function for automatic plateau recording. The check can be performed using the source at the measuring site or better a test source. Plot the measurement results in a curve (Fig. 4-3). The detector works perfect when you get a clearly visible plateau; the position of the plateau within the high voltage range does not matter. The plateau is recorded automatically. See also page 3-319.

![Plateau curve of NaI detector](image)

If the count rate changes by more than 5% per 100 V high voltage, or if the plateau is shorter than 50V, the scintillation counter will be unstable. In this case the complete detector or the crystal-multiplier assembly should be replaced.

**IMPORTANT**

The radiation conditions must be constant while recording the plateau!
4.5.2 Checking the Crystal-Multiplier Assembly

The plateau becoming too small or too steep indicates faults in the crystal-multiplier assembly. They can often be detected through visual inspection. To do this, take the crystal-multiplier assembly apart. To separate both parts, remove the Mu metal shielding and carefully detach the crystal from the multiplier window by gently sliding the crystal sideways. Wipe silicon oil traces off the mating faces of crystal and multiplier using a soft cloth. While you are doing this, make sure that the multiplier is not exposed to bright sunlight.

The crystal must be perfectly clear inside and not show any cracks or dull areas. The normal coloring is slightly greenish. A yellowish to brownish coloring is a sign of thermal overload and indicates that the crystal must be replaced.

The multiplier window is coated with a vapor-deposited layer acting as photo cathode. This layer gives the window a brownish tint similar to smoked glass. If this layer is no longer present or if it is stained, then the photo-cathode has been destroyed (e.g. by overheating, glass breakage, or incident light). The multiplier must be replaced. Faults caused by damage to the dynode systems (e.g. by excessive vibration) cannot be identified by appearance. If in doubt, replace the multiplier.

Before re-assembly, apply a drop of pure silicon oil (Berthold ID no. 18844) between crystal and multiplier, and distribute it evenly by gentle rubbing to ensure a sound optical connection between the two components. Using the adhesive tape, replace the Mu-metal screen, making sure that it is only under light tension.
4.6 Customer Service

Customer service for BERTHOLD TECHNOLOGIES measuring systems is available in many countries outside Germany. For further information please visit our website www.Berthold.com.

If you do not know the phone number of your local service engineer, please call one of the following numbers at BERTHOLD TECHNOLOGIES:

+49 (0) 7081 177-111 (phone)
+49 (0) 7081 177-339 (fax)
+49 (0) 7081 177-0 (switchboard)

e-mail: Service@Berthold.com

To get efficient help you have to provide the following information:

- Detector type or "LB" number, e.g. LB 480
- Information on the error
- Information on the application
  - Product being measured
  - Installation situation
  - Measuring system, e.g. limit switch, point source with CrystalSENS
- Parameter listing
- Source number and/or BERTHOLD TECHNOLOGIES commission number
- Contact person and phone number
4.7 Repair, Return Shipping

4.7.1 Electronics, Detector
If you intend to return parts or complete detectors for repair, please provide the following information:

- Detector type or "LB" number, e.g. LB 480
- Information on the error
- Delivery address
- Billing address
- Your order number (if necessary)
- Preferred mode of transportation (if necessary)
- Customs value (for cross-border shipment)

Delivery address of BERTHOLD TECHNOLOGIES:
BERTHOLD TECHNOLOGIES GmbH & Co. KG
Service Department
Calmbacher Str. 22
D-75323 Bad Wildbad

4.7.2 Source and Shielding
If source and/or shieldings have to be returned for repair, please contact the Supervisor of Transportation at BERTHOLD TECHNOLOGIES to clarify details:
+49 (0) 7081 177-219 (phone)

Please provide the following information:

- Name, address and telephone number of the Radiation Safety Officer
- Number of sources
- Source number(s)
- Isotope and activity
- Date of the last leak test
- State of the source(s) and the shielding(s)
- Information on the type of shielding, with which the source is to be transported (if available)
- Proforma invoice for the source and the shielding in which the source is returned (for customs purposes and only for cross-border transport)

The shipment is carried out either by a forwarder trained specifically for source transport or by air freight.

1.5 Sun Roof against Strong Sun Radiation
Sonnendach gegen starke Sonneneinstrahlung

Direct sun radiation can overheat the detector. If the detector temperature can reach more than 50°C, a suitable sun roof must be installed. The heating of the detector by thermal radiation from the vessel can also be moderated by a thermal sheet, e.g. by a thin metal plate. For each detector a water cooling (option) is available.

Wird durch Sonneneinstrahlung eine Detektortemperatur von über 50°C erreicht, so ist ein geeigneter Sonnenschutz zu montieren. Auch die Aufheizung des Detektors durch Wärmeabstrahlung vom Behälter kann durch ein dünnes Wärmeableitblech gemildert werden. Für jeden Detektor steht auch eine geeignete Wasserkühlung (Option) zur Verfügung.

2.5 SuperSENS (Version f. Divisions 1 + 2)

The detector version for divisions (NEC/CEC) differs only in the
terminal housing, compared to the standard version illustrated
above. The dimensions of this terminal housing are illustrated in
this drawing.

Die Detektor-Version mit Ex-Zulassung für Divisions (NEC/CEC)
unterscheidet sich ausschließlich im Anschlusskopf, verglichen mit
der oben aufgeführten Standardvariante. Die Abmessungen für
den Anschlusskopf sind aus dieser Zeichnung zu entnehmen.

6.1 Cable glands

The sealing of the screwed fittings on the cable can be made of several sealing rings, depending on the screwed fitting, which have to be adapted to the diameter of the cable. The sealing rings inserted into the screwed fittings allow a relatively large cable clamping area. Remove the sealing rings from the screwed fitting to adapt them to the cable diameter used. A list of screwed fittings available from BERTHOLD TECHNOLOGIES can be found in the manual for explosion protection on page 1-47.

The following is an example for a M20 cable gland with additional sealing ring for small cable diameters, that must be removed for cables with larger diameter.

**Übersicht Bestandteile**

Overview components

Adapter mit O-Ring, Klemmring, Druckring, Dichtung und Standard - Bluglobe®

Adapter with O-ring, Clamping ring, Pressure ring, sealing, and Standard - Bluglobe®

**Schritt 2 – Montage**

Step 2 – Installation

1. Kabel mit Länge X einführen, gemäß Tabelle (siehe unten)
   1. Install cable with length X according table (see below)
2. Doppelnippel mit Nenndrehmoment 1 gemäß Tabelle (siehe unten) anziehen zum Kontaktieren
   2. Fix double nipple D with torque 1 according table (see below) for contact
3. Druckschraube mit Nenndrehmoment 2 gemäß Tabelle (siehe unten) anziehen zur Abdichtung
   3. Fix pressure screw D with torque 2 according table (see below) for tightness
6.2 Limit Switches for Pneumatics

**IMPORTANT**

*If the limit-switch box ... -003U is delivered separately, it has to be stored in a plastic bag until it will be installed. The certification will keep its validity only if the limit-switch box has been installed correctly on the swivel drive.*

For indirect installation, the limit-switch box can be supplied, on customer’s request, with installation dimensions according to VDI/ VDE 3845 or according to KINETROL’s factory norm (see below).

**Direct installation**

- Unscrew the cover of the supplied limit-switch box and pull it off, as shown in the illustration, while pushing down the limit-switch shaft. Caution: Do not lose the cover sealing!
- Remove shaft mounting bracket by opening the screws and take off the limit-switch shaft.
- Clamp swivel drive in vise (use soft jaws)
- Apply LOCTITE (or a similar adhesive) on mounting thread, put on the supplied cork sealing and attach the bottom part of the limit-switch box. Fix it using the screws supplied.
- The two trip cams on the limit-switch shaft are fixed by one screw each. Untighten these screws.
- Place limit-switch shaft with the Allen key onto the upper four cornered shaft of the drive or the spring lock unit. DO NOT HAMMER – DO NOT APPLY FORCE!
- Install shaft mounting bracket again.

**Adjusting the trip cams**

- Set revolving wings of the swivel drive to the initial position. Caution: The mechanical end stops of the swivel drive should have been set already to make subsequent correction of the trip cams superfluous.
- Move the respective trip cams on the guide ring until a soft click indicates that the contact of the micro push-button (... -3U) or micro push-button (... -4U) has switched. To be on the safe side, move the trip cams by about 2-3 degrees further and tighten the clamping screw.
- Move revolving wings to the opposite stop position. Compressed air is needed for single-acting swivel drives with spring lock unit.
- Proceed accordingly with the second trip cam.

View without housing cover
After connecting, tighten the stuffing box fitting.

**IMPORTANT**

*Make sure that the cover sealing is inserted in its groove!*

Slightly grease the housing cover in the shaft duct with MoS₂ grease, attach it and tighten cover screws.
Correction of the switching points for drive with pre-assembled limit-switch box

Direct installation

- Unscrew the cover of the supplied limit-switch box and pull it off, as shown in the illustration, while pushing down the limit-switch shaft. Caution: Do not lose the cover sealing!
- Remove shaft mounting bracket by opening the screws and take off the limit-switch shaft.
- Apply LOCTITE (or a similar adhesive) on mounting thread, put on the supplied cork sealing and attach the bottom part of the limit-switch box. Fix it using the screws supplied.
- The two trip cams on the limit-switch shaft are fixed by one screw each. Untighten these screws.

Further steps see "Adjusting the trip cams" on page 2-214 and "Technical Specification / Electrical Wiring" page 2-215
Volume 3 Operation with HART® Communicator
HART® Communication

The LB 480 can be operated with the following hosts:

- HART® Communicator (375/475) by Emerson Process
- Siemens Simatic PDM
- AMS DeltaV by Emerson Process

1.1 HART® Protocol

The measured value in % level is transferred in the process variable PV.

1.2 General Information on the HART® Communicator

**IMPORTANT**
Changes in the parameters affect the behavior of any connected controller and can lead to undesirable operating conditions. Never change the parameter settings without a full knowledge of this User’s Manual as well as a full knowledge of the behavior of the connected controller and the possible influence on the operating process to be controlled.

The measuring system SENSseries LB 480 is compatible with the HART® Communicator Model 375 with firmware 3.0 and the Model 475 (HART® Communicator, HART = Highway Addressable Remote Transducer) by Emerson Electric Co.. Other HART® compatible communicators may also be used, provided they support Enhancements. The HART® Communicator uses the Bell 202 Frequency Shift Keying technique to superimpose high-frequency digital communication signals on the standard 420mA current loop. The minimum load resistance on the 420mA loop has to be 250 ohms. Refer to the instruction manual for the HART® Communicator for information on key usage, data entry and equipment interface.
1.3 Connection, Power On and Power Off of the HART® Communicator

Risk of explosion!

In hazardous areas, a HART® Communicator may be connected only under the following conditions:

- the current output of the measuring system SENSseries LB 480 is intrinsically safe
- the HART® Communicator is intrinsically safe
- the HART® Communicator has previously never been connected to non-intrinsically safe live electric cables.

The communicator may be switched on only after it has been connected to the HART® current output. Otherwise, communication with the detector is not established.

For safe HART® communication you need an impedance of at least 250 to maximum 500 ohms at the current output.

The Start menu appears as soon as the detector and the Communicator have been connected and commissioned properly (see page 3-235).

From this menu you may directly select the item Live Display for online display of the measured values. The measured data are only valid when the probe was calibrated and configured.

The Communicator may be turned off or disconnected only after completion of a possible parameter change of the detector.

1.4 Working with the HART® Communicator

The Communicator is easy to use:

- Use the arrow keys to select a menu item and then press the button with the right arrow key or the ENTER key. Alternatively, you can press the number listed in front of most menu items on the numeric keypad; then the menu item is called immediately.

- To change information or data, use the softkeys on which the valid function is depicted, e.g. SAVE, ABORT, OK, ENTER or SEND. Push HOME to return to the Start menu (see chapter 2.3, "Start Menu", page 3-235).

- Use the numeric keypad to enter numbers. With these keys you can also enter text for some menu items by pressing the appropriate number key repeatedly.
1.5 Archiving Parameter Sets

Parameter sets can be archived from the LB 480 to a PC via these hosts:
- HART® Communicator Model 375/475
- Siemens Simatic PDM
- AMS DeltaV, Emerson Process
- LB 480-PC (BERTHOLD TECHNOLOGIES specific program for the RS485 interface)

**IMPORTANT**

Depending on the HOST system, it may happen that certain parameters are not stored correctly. Therefore, verify the data stored after each archiving step. Even if you restore the saved data to the LB 480, you have to check the calibration setting afterwards.

1.5.1 HART® Communicator

The HART® Communicator Model 375/475 allows you to archive parameter sets. For this purpose, the parameter set first has to be saved using the software button **SAVE** from the detector to the SD card of the HART® Communicator. The stored data can then be archived to a PC via SD card or via infrared interface. First, preparatory actions have to be performed in the Online menu. The following sequence shows how the parameter set can be transferred from the detector to a PC via SD card.

1. Enter the file name of the parameter set for archiving in the **Tag** parameter.
   - **Command:** Tag
   - **Execution:**
     Online via the HART® Communicator in the Identification menu, select the Tag parameter and enter a name. Up to 8 characters.

2. Load current measurement parameters to the calibration parameters.
   - **Command:** Recall
   - **Execution:**
     Online via the HART® Communicator in the Cal Parameter menu, select the Recall command.

3. Save parameter set to the HART® Communicator.
   - **Command:** SAVE
   - **Execution:**
     Online via the HART® Communicator, push the software button SAVE on the display.
   - **Info:**
     The parameter set is now also available offline on the HART® Communicator.
4. Transfer parameter set to PC.
   You need the program "Easy Upgrade Utility" for this step. This program must be installed earlier on the PC.
   
   Execution:
   - Remove SD card from 475 and insert it into the SD card reader of your PC.
   - Start Easy Upgrade Utility.
   
   The following steps describe the sequence in "Easy Upgrade Utility":
   - ("Update PC" recommended)
   - Connection type: Card Reader
   - "Connect"
   - Select "More options ...".
   - Select "HART configuration" tab.
   - Select a file in the right box and upload it to the PC database in the left box.
   
   The parameter set can now be displayed, or printed, by double-clicking.
   
   For more information about "Easy Upgrade Utility" please refer to the Online help.

To transfer already archived files to the detector:

1. Transfer the file from PC to SD card using "Easy Upgrade Utility".

2. Insert SD card again in the HART® Communicator.

3. Select the parameter set in the offline mode of the HART® Communicator and transfer it to the detector with the Send command.

   To update the data, you have to restart the HART® Communicator.

For archiving with other hosts please see the following chapter.
1.5.2 PDM (Siemens Simatic PDM)

The PDM can also store data in the offline menu. Again, you have to select Recall on the Cal Parameter menu.

When restoring the data to the detector, it is necessary to transfer the data twice to the detector. This ensures that the data will be properly enabled in the detector.

1.5.3 AMS (DeltaV Emerson Process)

The AMS can save data in the offline menu only from version 10 and above. Again, you have to select Recall on the Cal Parameter menu.

- However, safe transfer of data from the offline menu to the detector can only be guaranteed by transmitting each parameter individually. You have to check whether the corresponding value has actually been transmitted properly. Then in addition you have to select Restore in the Cal Parameter menu to transfer the calibration values into the measurement parameters.
Menu Structure

2.1 Information on the Menu Structure

The menu structure on the following pages provides an overview over all functions of the SENSseries detectors. Using the page numbers indicated you can look up explanations on the function of each menu item.

To rule out incorrect entries, you always have to push the SEND softkey immediately after you have entered a value via the ENTER button. The SEND softkey is only visible after values have been changed.

- Push ENTER to save edited values and parameters in the Communicator.
- Push SEND to transfer all modified values from the Communicator to the detector.

The following sections assume that you:
- know how to work with the Communicator
- have read and understood Volume 2 (Installing SENSseries) of this User’s Manual.
2.2 Menu Overview

The parameters shown in gray type appear only in certain settings. Please refer to the respective parameter description.
Quick Start, page 3-240

Step 1
- Date
- Time
- Cal
- Nuclide
- Calibration Method
- Switch Function
- Readin Time

Step 2
- Measuring Path
- Product Density

Step 3
- Readin
- Background
- Lower Cal Pt-Empty
- Upper Cal Pt-Full
- Calibrate + Auto Set

Step 4
- Readin
- Background
- Lower Cal Pt-Empty
- Upper Cal Pt-Full
- Calibrate + Auto Set

Sensor Configuration, page 3-246

Date & Time
- Date

The parameters shown in gray type appear only in certain settings. Please refer to the respective parameter description.
2.3 Start Menu

The Start menu is the first and highest level for communication with the SENSseries. From the Start menu you have access to all other menu items.

The Start menu appears if you...

- switch on the connected HART® Communicator or
- push the HOME softkey anywhere in the menu.

1 Live Display  
Shows the menu with the currently measured values (page 3-236).

2 Device Config  
Leads to the menu for setting the detector parameters (page 3-238).

3 Diagnostic  
Opens the menu displaying status and error information and the protocols for errors and parameter changes (page 3-293).
2.4 Live Display

1 Operating Mode

Shows the current operating status.

The following states may occur:

- **RUN**
  The measurement is in the normal measurement mode.

- **WARNING**
  A warning message of error category 2 is displayed.
  If the error is no longer displayed in **Active Error**, you can check the error log (Device Config ▶ Diagnostic ▶ Log, page 3-295). In **chapter 8** on page 3-335 you find a list of possible causes and troubleshooting procedures.

- **ERROR**
  An error of error category 1 is displayed.
  If the error is no longer displayed in **Active Error**, you can check the error log (Device Config ▶ Diagnostic ▶ Log, page 3-295). In **chapter 8** on page 3-335 you find a list of possible causes and troubleshooting procedures.

- **SHUTDOWN**
  A serious error of error category 0 is displayed.
  If the error is no longer displayed in **Active Error**, you can check the error log (Device Config ▶ Diagnostic ▶ Log, page 3-295).
  In **chapter 8** on page 3-335 you find a list of possible causes and troubleshooting procedures. If the error does not disappear after restart (power off and then on, or software reset, page 3-278), then the detector must be replaced.

- **HOLD**
  The measurement is in the hold state, which means that the measured value and the current output signal is frozen. This status can occur under the following conditions:
  - the plateau recording is running
  - interference radiation was detected
  - the digital input is on Hold

- **TEST**
  A test value is enabled, see **chapter 2.35**, page 3-280.
2 Level
Indication of the current level in percent (primary variable).
The measured value shows you if
- calibration utilizes or exceeds the measuring range
- wall deposits build up
- the calibration is correct
- a possible gas density was sufficiently taken into account when calibrating

3 Current Out
Displays the actual output current at the analog output in mA.

4 Cps Average
Shows the current count rate averaged over the time constant.

5 Cps Live
Shows the current non-averaged count rate.

6 Alarm State
Indicates whether the switching threshold (alarm threshold for the level) is exceeded or fallen short of.
- **OFF** = no alarm
- **ON** = alarm

7 Threshold
After calibrating the automatically detected or manually set switching point of the switching threshold (alarm threshold) is displayed. The value is displayed in % and refers to the area that is determined by the count rates for empty and full. Empty corresponds to 0%, full to 100%.

8 HV Live
Displays the current HV (high voltage) at the photomultiplier. If HV Mode is set to **AUTO** (normal operation), the values in HV Live must change, viewed over several seconds.

9 Device Temp.
Displays the temperature inside the detector.

10 Trend
Displays the trend of important measured values such as level, count rate and HV.
2.5 **Device Config**

1 **Setup**

Opens the Setup menu. If *Setup locked!* appears here, then the access has to be enabled via **Access** (*page 3-239*).

2 **Meas Parameter**

Leads to the menu displaying the currently valid measurement parameters that are used to determine the measured value. Each calibration with **Calibrate** overwrites these values again. These readings help the user to check his calibration (*page 3-285*).

3 **Access**

Opens the menu for entering the password, the options to prevent configuration changes and to activate the safety mode (*page 3-289*).

4 **Identification**

Opens the menu displaying various detector parameters, such as model, device ID, software and hardware revision (*page 3-291*).
2.6 Setup

Menu path: **Device Config ▶ Setup**.

These menus allow you to make changes to the settings and the calibration of the detector. Upon delivery of the instrument, access to all menu items is possible without password. If a password has been entered and activated, you must enter it again to allow access (see chapter 2.45, page 3-289).

Use **Recall** *(Device Config ▶ Setup ▶ Cal Parameter ▶ Recall, page 3-257)*, if you only want to change a few settings. This will copy the current settings in the menus for the setup and you can make changes to individual settings.

Enable the changes with **Calibrate** *(Device Config ▶ Setup ▶ Cal Parameter ▶ Calibrate)*, see chapter 2.20, page 3-257.

1 Quick Start
- Opens a menu that enables fast user-guided, initial configuration of the detector *(page 3-240).*

2 Sensor Configuration
- Opens the menu for the sensor settings *(page 3-246).*

3 Signal Condition
- Opens the menu for the signal processing settings *(page 3-250).*

4 Cal Parameter
- Opens the menu for the calibration *(page 3-257).*

5 I/O Setup
- Opens the menu for the I/O functions *(page 3-270).*

6 Service
- Opens the menu for testing and service functions as well as for the plateau measurement and display of the plateau values *(page 3-278).*
2.7 Quick Start

Menu path: Device Config ▶ Setup ▶ Quick Start.

Quick Start allows you to quickly take the detector into operation, without having to deal with the complete menu. If you also need a special feature from the main menu, you can activate it there any time. Please note that the function Calibrate + Auto Set in the Quick-Start menu automatically set certain other parameters in addition to the calibration.

**IMPORTANT**
Changes in the Quick Start menu must finally be activated with Calibrate + Preset (in Step 3).

2.8 Quick Start, Step 1

Enter the current date and time.

The correct date is important for the automatic decay compensation of the isotope. Since the activity of the source diminishes with time, the calibration count rates will be compensated automatically through the date. The decay compensation takes place daily at 09:01 h

1 Date
Current date. The date is specified in the following format:

MM/DD/YYYY.

If the detector detects that the date deviates, a date error is indicated. If Error Handling is set to NORMAL, then the detector continues to work with the stored date. Otherwise (setting SENSITIVE) the current output also goes to fault current.

2 Time
Current time. The time is specified in the following format:

hh:mm:ss

Differences in time have virtually no effect on the correction of the decrease in activity. However, the correct time is helpful to check the detector function: If an error occurs, you can see in the error log (Device Config ▶ Diagnostic ▶ Log, page 3-295) when exactly the error occurred.
2.9 Quick Start, Step 2

1 Nuclide

- Enter here the isotope (nuclide) that is used in your source:
  - Co-60
  - Cs-137
  - USER DEFINED

This entry controls the automatic decay compensation. The correct entry is also important in a single-point calibration and for gas density compensation. The isotope used is listed on the type plate of the shielding and on your delivery documents. The item USER DEFINED allows you to use any isotope you want. In this case, additional parameters are requested: Specify the half-life under Half Life Time and the absorption coefficient at Absorption.

What happens when you have selected the wrong isotope?

Incorrect measurements as a result of the wrong decay compensation occur only after several weeks or months. If you also enter values for the product or gas density, incorrect switching thresholds will then be calculated (alarm thresholds for the level). With incorrect isotope selection for a one-point calibration, the calibration point for 100% will be calculated incorrectly.

2 Calibration Method

You can choose from the following calibration methods:

- **1-POINT**
  
  Use the 1-point calibration only if full calibration is not possible. This method requires an empty calibration (level below monitoring level). Using additional inputs such as product density and measuring path, the count rate for the full adjustment (level above the monitoring level) is then calculated automatically.

- **2-POINT**
  
  An empty calibration (level below the monitoring level) and a full calibration (level above the monitoring level) is required for a two-point calibration. Perform empty and full adjustment in Step 4 (page 3-243).

**Tip**

Since the full calibration is actually measured and not only calculated, a better display accuracy will be achieved with this setting.
3 Switch Function

You can specify whether the limit switch is used as a High Alarm or as a Low Alarm. The switching direction affects the fail-safe function of the digital output (open collector). To output the alarm as a signal via the open collector, you have to set Digital Out Function in the I/O Setup menu (page 3-270) to LS ALARM.

You have the following setting options:

- **MAX**
  The alarm is triggered if the switching threshold is exceeded (High Alarm).

- **MIN**
  The alarm is triggered when falling below the switching threshold (Low Alarm).

- **MAX + BUILD UP**
  The alarm is triggered if the switching threshold is exceeded (High Alarm). In addition, monitoring is performed which triggers an alarm if wall deposits\(^1\) (build-up) are detected. Prerequisite for correct function is that both the count rate for empty and the count rate for full was measured. During the measurement of the empty value it must be ensured that no build-up occurs.

4 ReadIn Time

You can specify over which period of time the count rate is read. The statistical variation of the count rate is averaged over this time period. The longer it is, the better the mean value. A time period of 60s (default setting) is usually reasonable.

---

1. The function enables the early detection of wall deposits, i.e. before the reliable switching function is no longer guaranteed. The BUILD UP function, however, increases the time constant automatically and thus the reaction time.
2.10 Quick Start, Step 3

In this step, enter the product parameters if you have selected the setting **1-POINT** in **Step 2** as **Calibration Method**. Otherwise, continue with Step 4.

1 Measuring Path

- Enter the measuring path of the beam path in the product that is to be measured in mm. Generally, this corresponds to the inner diameter of the container.

2 Product Density

- For liquids, enter the liquid density, for bulk material, the bulk density of the product to be measured in kg/m³. If you known the liquid density and the bulk density only approximately, then you have to enter the lowest expected value.

2.11 Quick Start, Step 4

In this step, the calibration data are determined and the detector is calibrated. Then the resulting data is transmitted to the **Meas Parameter** menu and enabled.

1 ReadIn

Start reading-in the count rates. While the count rate is read in, the average is calculated and displayed continuously. Under **ReadIn Time** (**Quick Start, Step 2**) you define the read-in period.

First choose which calibration point you want to read in:

- **BACKGROUND**
  The background radiation has to be measured so that the detector can correctly compensate for the decay of the radiation source. Before taking measurements, make sure you do not measure any radiation from the radiation source. The easiest way to ensure this is if the source is not yet mounted. Otherwise, close the beam path and fill the container in addition.

- **LOWER-PT**
  For this measurement, the level in the tank must be below the monitoring level or the tank must be completely empty. While you read-in, the level must not rise above the switching threshold and the conditions within the tank must match the conditions during operation as far as possible. If appropriate for your application and if it affects the beam path, this applies, for example, to:
  - Gas density
  - Agitator
  - Cooling/Heating jacket
• **UPPER-PT**

This measurement can only be performed at a 2-point calibration ([Step 2 ▶ Calibration Method: 2-POINT](#)). For the measurement, the level in the tank must be above the monitoring level or the tank must be completely filled. While you read-in, the level must not drop below the switching threshold and the conditions within the tank must match the conditions during operation as far as possible. If appropriate for your application and if it affects the beam path, this applies, for example, to:

- Gas density
- Agitator
- Cooling/Heating jacket

When reading-in the count rates, the time remaining up to the end of the operation is displayed. Finally, you are prompted to confirm the detected count rate with **OK**. To shorten the read-in process, you can stop any time by pressing **OK**.

### 2 Background

The term background refers to the background radiation which is present in the environment. The background radiation has to be measured so that the detector can correctly compensate for the decay of the radiation source.

▶ Select **ReadIn** to read in the count rate for the background radiation. If you already know the value, you can enter it here.

### 3 Lower Cal Pt-Empty

Count rate with empty container or at a level below the switching threshold.

▶ Select **ReadIn** to read in the count rate. If you already know the value, you can enter it here.

### 4 Upper Cal Pt-Full

Count rate with full container or at a level above the switching threshold.

If you have selected in [Step 2 ▶ Calibration Method](#), page 3-241, the setting **1-POINT**, the value for **Upper Cal Pt-Full** is automatically calculated from the value of **Lower Cal Pt-Empty** and the parameters defined in the **Product Conditions** (page 3-267) menu.

▶ Select **ReadIn** to read-in the count rate, if you have chosen the setting **2-POINT** at **Calibration Method**. If you already know the value, you can enter it here.
6 Calibrate + Auto Set

With this menu item you enable the calibration data determined during the measurements. The calibration data are transferred to the parameter set Meas Parameter. Thus, the detector will get a new calibration which in the future will be used to determine the measured values. The optimum switching threshold and the time constant will be calculated automatically.

After the calibration, a status message is displayed, indicating if the activation of the calibration data has been carried out successfully. If not, the measurement parameters are unchanged. Possible status messages are:

- **0-OK**
  The calibration carried out is OK.

- **1-ERROR BACKGROUND**
  The count rate of the background radiation is higher than that for the calibration points for empty or full (Lower Cal Pt-Empty or Upper Cal Pt-Full).

- **2-ERROR CALIBRATION POINT**
  The empty count rate is lower than the full count rate (Lower Cal Pt-Empty < Upper Cal Pt-Full).

- **3-ERROR THRESHOLD / TIME CONSTANT**
  The switching threshold (Threshold) is too close to one of the calibration points for empty (Lower Cal Pt-Empty) or full (Upper Cal Pt Full) or in the manual calibration, the time constant is too small. The error also occurs when the time constant exceeds 999 s.

- **4-ERROR THRESHOLD OUT OF RANGE**
  The switching threshold (Threshold) plus or minus the hysteresis exceeds the allowable range of 0% ... 100%.

- **5-ERROR BU TC**
  The time constant for the build-up alarm is above 14,400 seconds. This is either because the difference between empty count rate and full count rate is too low (Lower Cal Pt-Empty \approx Upper Cal Pt-Full) or the limit value is too close to one of the calibration points for empty (Lower Cal Pt-Empty) or full (Upper Cal Pt-Full).

- **6-DATE ERROR**
  A date is still set to the default value of 1.1.2000. At Calibrate, check the Date parameter. At Restore, check the date in Restore Date.

- **7-CHECK ERROR**
  The status of the calibration parameters could not be fully verified. In this case, repeat the calibration. If the error occurs again, replace the detector, at least the detector electronics.

**NOTICE**

The above described plausibility check cannot prevent that the user may read-in incorrect data. If in doubt, please consult a BERTHOLD TECHNOLOGIES service technician.
The following settings are made automatically at **Calibrate + Auto Set**:

- **Evaluation Mode** = *AUTO SET*
- **OP Gas Density** = 0
- **Setup Gas Density** = 0
- **Bulk Cone** = 0

### 2.12 Sensor Configuration

Menu path: **Device Config ▶ Setup ▶ Sensor Configuration**.

The **Sensor Settings** are preset at the factory.

#### 1 Date & Time

Opens the menu for the date and time (*page 3-246*).

#### 2 Sensor Settings

Opens the menu for the detector code and HV settings (*page 3-247*).

### 2.13 Date & Time

Menu path: **Device Config ▶ Setup ▶ Sensor Configuration ▶ Date & Time**.

The correct date is important for the automatic decay compensation of the isotope. Since the activity of the source diminishes with time, the calibration count rates will be compensated automatically in the **Meas Data** menu through the date. The decay compensation takes place daily at 09:01 h. A capacitor ensures that the date and time continue to run for about a month even when the detector is turned off and even if the power supply is switched off. If the detector has not been supplied with power for a longer period of time (several weeks), then the capacitor may be empty. If the power supply is switched on again, then the clock starts with the last saved date and an error message "Real time clock not valid" indicates that the date must be updated.

#### 1 Date

Current date. The date is specified in the following format: MM/DD/YYYY.

If the detector detects that the date deviates, a date error is indicated. The response of the signal output is dependent on the setting for **Error Handling** (*Signal Parameter, page 3-251*):

- **NORMAL**
  
  The measurement continues with the last saved date.

- **SENSITIVE**
  
  The measurement goes to the safe condition and the current output goes to fault current.
2 Time

Current time. The time is specified in the following format:

hh:mm:ss

Differences in time have virtually no effect on the correction of the decrease in activity. However, the correct time is helpful to check the detector function: If an error occurs, you can see in the error log (Device Config ➤ Diagnostic ➤ Log, page 3-295) when exactly the error occurred.

2.14 Sensor Settings

Menu path: Device Config ➤ Setup ➤ Sensor Configuration ➤ Sensor Settings.

The Sensor Settings are preset at the factory.

1 Error Code

Indicates if an error message is present.

If no error is present, then "0" is displayed here.

An error message is displayed with a three digit number. The cause of the error and suggestions for correcting the error are described in chapter 8, "Error Handling".

2 Detector Code

The detector code is crucial for the proper function of the automatic HV control (high voltage control). The currently selected detector code is displayed.

The detector code has already been set by BERTHOLD TECHNOLOGIES. It is dependent on the scintillator size and the detector type, see Volume 2, chapter 1.6, "Detector Codes", on page 2-151.
3 HV Mode

The HV-mode (high-voltage control) provides the following options:

- **AUTO**
  Automatic HV control. Select this mode in normal measurement mode. It enables a temperature-stable operation of the detector.

- **MANUAL**
  Manual HV control. This setting is used for testing purposes; you can also provisionally set the operating point of the detector. The specified voltage must, however, lie in the plateau.

  If you select Manual, the automatic HV control is switched off. The HV is then set to the value that was set in the menu item HV Manual (6).

- **PLATEAU**
  Starts the plateau measurement. If you select PLATEAU, the measurement mode is exited and the plateau of the multiplier measured, which is used in the detector. The plateau is measured using the settings in the menu Device Config ▶ Setup ▶ Service ▶ Plateau.

  At the end of the plateau measurement the detector automatically switches back to HV Mode: AUTO or MANUAL, depending on which mode was last set.

4 HV Live

Displays the current HV (high voltage) at the photomultiplier. If HV Mode is set to AUTO (normal operation), the values in HV Live must change, viewed over several seconds.

5 HV Average

Shows the average HV (high voltage) of the last 10 days.

Significant deviations from HV Live to HV Average are considered and reported as errors.

If you change HV Default, HV Average automatically takes over the value from HV Default.

6 HV Manual

You can enter a fixed HV value. The value becomes active when you select MANUAL at HV-Mode.
7 HV Default

**HV Default** causes:
- A quick operation point control after power failure
  After a power failure, the HV starts at the last HV Average value which results from the HV Default. This will significantly reduce the start-up phase after power failure.
- Error detection in case of HV-drift
  If the HV deviates too far (+40%, -20%) from the HV Default or if the HV reaches the limits of the range of 300 V or 1300 V, this is reported as an error.
- Special feature: 0V
  For maintenance purposes, the HV Default can also be set to 0V. In this case, the mechanisms described above are suspended; after a power failure, the measurement begins to get adjusted at 800 V.

**HV Default** has already been determined and set by BERTHOLD TECHNOLOGIES. If this value deviates during the first commissioning by more than 5% from **HV Live**, then you have to adjust **HV Default** new.

► Set **HV Default** to 0.

► Read off the value in **HV Live** 30 minutes later.

► Enter the value read in **HV-Default**.

With the CrystalSENS, please note that the count rate during this process is above 300 cps to allow the HV to adjust itself.

---

**Tip**
The operating point in new detectors is usually between 400 to 900 V. If you get a different value, please contact BERTHOLD TECHNOLOGIES or your local representative.

---

8 Cps Live

Shows the current non-averaged count rate.
2.15 Signal Condition

Menu path: Device Config ▶ Setup ▶ Signal Condition.

This menu contains some special features which have a direct impact on the signals of the measurement:

- the way of signaling
- general warning and error messages
- special warning signs for early detection of functional limitations

An important issue are the settings in the menu item Error Handling in the Signal Parameter menu.

1 Signal Parameter

Opens the menu for error handling and settings for the signal output (page 3-251).

2 Radiation Interference

Opens the menu for the interference radiation detection (page 3-253).

3 Source Exchange

Opens the menu for settings regarding time constant and source exchange (page 3-255).

4 Build Up Alarm

Opens the settings for the pre-alarm in case of wall deposits (page 3-256).
2.16 Signal Parameter

Menu path: Device Config ► Setup ► Signal Condition ► Signal Parameter.

1 Error Handling

Here you can set a different weighting of errors and error handling:

- **SENSITIVE**
  
  All faults cause the current output to report a Fault current. To also get warning messages, you must also evaluate the messages via the HART® signal or the digital output.

  The setting **SENSITIVE** is automatically enabled when the Safety Mode is selected.

- **NORMAL**
  
  Only fatal errors are reported as a fault current. Thus, the measured value via the current signal will fail only if the measurement can no longer be used.

  To also get minor error and warning messages, you must also evaluate the messages via the HART® signal or the digital output.

**IMPORTANT**

*You may select the NORMAL setting only if hazards to persons or the environment or damage to property as a result of a faulty measured value can be ruled out.*

To use the digital output for the above mentioned messages, you need to use the setting **WARNING + ERROR** in the menu Digital Out Function (Device Config ► Setup ► I/O Setup ► Digital Output ► Digital Out Function, page 3-273).

**Tip**

Error handling is described in detail in chapter 8 starting on page 3-335.
2 Transfer Function

Here you can specify how the current output should behave in case of a change in level:

- **LINEAR**
  A continuous 4-20 mA signal is output which is proportional to the count rate.

- **DISCRETE SWITCH**
  Depending on the set switching threshold (alarm threshold for the level) a current of 4 mA or 20 mA is output. Values between 4 and 20 mA will not be output.

3 Signal Unlocked

You will get alerted when the device is unlocked with a password. The warning message 901 is output. Choose **WARNING** only if the control system is to be alerted when the device was unlocked with the password.

- **OFF**
  The function is switched off.

- **WARNING**
  Once the detector is unlocked with a password, a warning is issued. If **Error Handling** is set to **SENSITIVE**, then a fault current is output in addition to the alarm.

The reaction can be identified based on the list in chapter 8.2 on page 3-336.
2.17 Radiation Interference

Menu path: **Device Config ▶ Setup ▶ Signal Condition ▶ Radiation Interference.**

Use this menu, for example, to detect external radiation from weld inspections, or short-term use of other sources in the vicinity of the detector.

If the current count rate exceeds the threshold set in **Io Factor**, the warning message *Interference radiation* is output. In this case:

- the measured value is frozen and
- the current output holds the last measured value

The measurement remains frozen as long as external radiation is present, plus the waiting time that has been set in **Waiting Time**. To get the warning messages, you have to evaluate the messages via the HART® signal or the digital output.

**IMPORTANT**

*If interference radiation detection is enabled, the measured values are output with a delay. The delay is adjustable from 0 to 5 seconds.*

*The delay is required so that at the moment of detection the measured value remains unaffected, even though in this case, increased count rates are already present. For this reason, while interference radiation detection is active, no applications can be run where the reaction time must be below the set delay.*

For detailed information please refer to the section Interference Radiation Detection in chapter 7.4, page 3-328.

### 1 Response Mode

- Select the response mode:
  - **DISABLED**
    Interference radiation detection is disabled.
  - **RAD. INTERFERENCE**
    Interference radiation detection is enabled.
2 Io Factor

Defines the threshold where the interference radiation detection responds. With the default value of 1.5, the threshold is 1.5 times the active empty count rate and is suitable for most applications.

You can adjust the factor for the threshold yourself. Note that a value below 1.5 may trigger faulty switching caused by fluctuations in the measured values. Increasing the factor decreases the sensitivity. Increase the factor if false alarms are triggered by significant fluctuations in the measured values, for example, by agitator blades.

3 Waiting Time

If interference radiation is detected, the measured value is "frozen" and will be released at the earliest after the waiting period is over. You have to enter the value for the waiting time in seconds.

4 Meas Delay Time

If interference radiation detection is enabled, the measured values are output with a delay. The delay is adjustable from 0 to 5 seconds. The delay is required so that at the moment of detection the measured value remains unaffected, because in this case, increased count rates are already present which may distort the measured value.
### 2.18 Source Exchange

Menu path: **Device Config ▶ Setup ▶ Signal Condition ▶ Source Exchange.**

Often, it is not apparent to the user when a source must be replaced. Activate the message *Source Exchange*, if you want to be warned in time that the source has to be replaced. Reasons for source replacement may be to ensure the measurement function, or, for radiation protection reasons, a maximum service life of the source.

To get the warning messages, you have to evaluate the messages via the HART® signal or the digital output.

**IMPORTANT**

*Usually, the manufacturer recommends a service life of the source of about 10 years. A longer service life of the source has to be clarified with the Radiation Safety Officer in charge who is familiar with the local radiation protection requirements. The service life approved by the Radiation Safety Officer limits the maximum period of use, even if a longer technical service life is displayed under Warning Date. In this case, select DATE at Selection and enter the source exchange date specified by the Radiation Safety Officer.*

#### 1 Selection

- **OFF**
  
  No message is output.

- **DATE**
  
  The message *Source Exchange* is output on a specific date. Enter the date in Warning Date.

- **TIME CONSTANT**
  
  In Max Time Constant enter a maximum time constant when a certain response time of the measurement should not be exceeded. (The response time is approximately equal to the time constant.)

  After entering the maximum time constant, the detector automatically calculates the date of the source exchange. The date is displayed under Date.

**IMPORTANT**

*To use the function TIME CONSTANT, you must set Evaluation Mode (Device Config ▶ Setup ▶ Cal Parameter ▶ Cal Settings ▶ Evaluation Mode) to AUTO SET. In the MANUAL setting the time constant is not adjusted automatically.*

#### 2 Warning Date

- If you have selected DATE at Selection, you have to enter the date when you want to get the Source Exchange warning (format: MM/DD/YYYY.)
3 Max Time Constant

If you have selected **TIME CONSTANT** at **Selection**, you have to enter here the maximum allowable time constant.

The maximum allowable time constant must be greater than the current, automatically calculated time constant (see **Time Constant**). The value of the time constant approximately corresponds to the response time of the measurement. After entry of a value, the date on which the warning will be expected is displayed in **Warning Date**.

Due to the automatic decay compensation, the time constant is increased constantly until the maximum time constant is reached, whereupon the source exchange warning message is reported.

4 Time Constant

Shows the current time constant.

---

2.19 Build Up Alarm

Menu path: **Device Config ► Setup ► Signal Condition ► Built Up Alarm.**

1 BU Delay Time

This parameter defines the response time in seconds until a build-up alarm is output. The time period is dependent on the container filling rate, i.e. the time that the level needs to undergo a change in level of 5 cm.

The time period has to be entered to ensure the correct evaluation of the build-up alarm. The longer you choose this time, the more the alarm evaluation will be delayed. However, wall deposits build up, in most cases, over an operating time of several hours or even days. Therefore, a value for the **BU Delay Time** ranging from several minutes to hours is possible. In case of doubt, enter a longer time.
### 2.20 Cal Parameter

Menu path: **Device Config ➤ Setup ➤ Cal Parameter.**

In this menu you can calibrate and adjust the measuring system and set the parameters needed to perform the measurement.

#### Readjustment of an already calibrated measurement:

The count rates in this menu and the submenus are not decay compensated\(^1\). For this reason, after several weeks the calibration characteristic curve cannot be changed using data from **Cal Parameter**; rather, it must be changed using the values from **Meas Parameter**. These values correspond to the data the LB 480 is currently using to run measurements. The data in **Meas Parameter** also include the decay compensated count rates of the calibration points which were used last to calibrate the LB 480. Select **Recall** to obtain the decay compensated values. The current values from **Meas Parameter** (**Device Config ➤ Meas Parameter**) are copied back here.

</tbody>
</table>

---

1. Each source will lose activity over time and become weaker; this is called source decay. For this reason, the count rate measured at the detector decreases in the course of time. The process can be calculated using a mathematical function and is automatically compensated for by the SENSseries detectors.
5 Calibrate

With this menu item you enable the calibration data determined during the measurements. In this case, the calibration data are transferred from **Cal Parameter** to **Meas Parameter**. Thus, the detector will get a new calibration which in the future will be used to determine the measured values.

After the calibration, a status message is displayed, indicating if the activation of the calibration data has been carried out successfully. If not, the measurement parameters are unchanged. Possible status messages are:

- **0-OK**
  The calibration carried out is OK.

- **1-ERROR BACKGROUND**
  The count rate of the background radiation is higher than that for the calibration points for empty or full (Lower Cal Pt-Empty or Upper Cal Pt-Full).

- **2-ERROR CALIBRATION POINT**
  The empty count rate is lower than the full count rate (Lower Cal Pt-Empty < Upper Cal Pt-Full).

- **3-ERROR THRESHOLD / TIME CONSTANT**
  The switching threshold (Threshold) is too close to one of the calibration points for empty (Lower Cal Pt-Empty) or full (Upper Cal Pt-Full) or the time constant was selected too small for the manual calibration. The error also occurs when the time constant exceeds 999 s.

- **4-ERROR THRESHOLD OUT OF RANGE**
  The switching threshold (Threshold) plus or minus the hysteresis exceeds the allowable range of 0% ... 100%.

- **5-ERROR BU TC**
  The time constant for the build-up alarm is above 14,400 seconds. This is either because the difference between empty count rate and full count rate is too low (Lower Cal Pt-Empty ≈ Upper Cal Pt-Full) or the limit value is too close to one of the calibration points for empty (Lower Cal Pt-Empty) or full (Upper Cal Pt-Full).

- **6-DATE ERROR**
  A date is still set to the default value of 1.1.2000. At Calibrate, check the Date parameter. At Restore, check the date in Restore Date.

- **7-CHECK ERROR**
  The status of the calibration parameters could not be fully verified. In this case, repeat the calibration. If the error occurs again, replace the detector, at least the detector electronics.
6 Recall

Allows you to copy the current data set from Meas Parameter to Cal Parameter. This allows you to revise the valid parameters, without this having an influence on the measurement at first. After you have finished editing, you can activate the changed settings with Calibrate.

Recall is also necessary because the count rates in the calibration parameters (Cal Parameter) in contrast to the count rates of the measuring parameters (Meas Parameter) are not decay compensated.

**IMPORTANT**

Recall overwrites all settings of the Cal Parameter menu.
2.21 Cal Points

Menu path: Device Config ► Setup ► Cal Parameter ► Cal Points.

**IMPORTANT**
Changes in this parameter group have an effect only when you call Calibrate (Device Config ► Setup ► Cal Parameter ► Calibrate, page 3-257).

This menu allows you to adjust the measuring system.

1 ReadIn

Start reading-in the count rates. While the count rate is read in, the average is calculated and displayed continuously. The duration of the reading-in process is defined via ReadIn Time (Device Config ► Setup ► Cal Parameter ► Cal Settings ► ReadIn Time).

First choose which calibration point you want to read in:

- **BACKGROUND**
  The background radiation has to be measured so that the detector can correctly compensate for the decay of the radiation source. Before taking measurements, make sure you do not measure any radiation from the radiation source. The easiest way to ensure this is if the source is not yet mounted. Otherwise, close the beam path and in addition fill the container.

- **LOWER-PT**
  For this measurement, the level in the tank must be below the monitoring level or the tank must be completely empty. While you read-in, the level must not rise above the monitoring level and the conditions within the tank must match the conditions during operation as far as possible. If appropriate for your application and if it affects the beam path, this applies, for example, to:
  - Gas density
  - Agitator
  - Cooling/Heating jacket
- **UPPER-PT**

  This measurement can be performed only at a 2-point calibration (Device Config ▶ Setup ▶ Cal Parameter ▶ Cal Settings ▶ Calibration Method: 2-POINT). For the measurement, the level in the tank must be above the monitoring level or the tank must be completely filled. While you read-in, the level must not drop below the switching threshold and the conditions within the tank must match the conditions during operation as far as possible. If appropriate for your application and if it affects the beam path, this applies, for example, to:
  - Gas density
  - Agitator
  - Cooling/Heating jacket

  When reading-in the count rates, the time remaining up to the end of the operation is displayed. Finally, you are prompted to confirm the detected count rate with **OK**. To shorten the read-in process, you can stop any time by pressing **OK**.

2 **Background**

  The term background refers to the background radiation which is present in the environment. The background radiation has to be measured so that the detector can correctly compensate for the decay of the radiation source.

  ▶ Select **ReadIn** to read in the count rate for the background radiation. If you already know the value, you can enter it here.

3 **Lower Cal Pt-Empty**

  Count rate with empty container or at a level below the switching threshold.

  ▶ Select **ReadIn** to read in the count rate. If you already know the value, you can enter it here.

4 **Upper Cal Pt-Full**

  Count rate with full container or at a level above the switching threshold.

  If you have selected in Calibration Method (Device Config ▶ Setup ▶ Cal Parameter ▶ Cal Settings ▶ Calibration Method, page 3-262) the setting 1-POINT, the value for Upper Cal Pt-Full is automatically calculated from the value of Lower Cal Pt-Empty and the parameters defined in the Product Conditions (page 3-267) menu.

  ▶ Select **ReadIn** to read-in the count rate, if you have chosen the setting 2-POINT at Calibration Method. If you already know the value, you can enter it here.
2.22 Cal Settings

Menu path: Device Config ► Setup ► Cal Parameter ► Cal Settings.

The basic settings for the calibration are defined in this menu.

**IMPORTANT**

Changes in this parameter group have an effect only when you call Calibrate (Device Config ► Setup ► Cal Parameter ► Calibrate, page 3-257).

**1 Nuclide**

- Enter here the isotope (nuclide) that is used in your source:
  - Co-60
  - Cs-137
  - USER DEFINED

This entry controls the automatic decay compensation. The correct entry is also important in a single-point calibration and for gas density compensation. The isotope used is listed on the type plate of the shielding and on your delivery documents. The item **USER DEFINED** allows you to use any isotope you want. In this case, additional parameters are requested: Specify the half-life under **Half Life Time** and the absorption coefficient at **Absorption**.

What happens when you have selected the wrong isotope?

Incorrect measurements as a result of the wrong decay compensation occur only after several weeks or months. If you also enter values for the product or gas density, incorrect switching thresholds will then be calculated (alarm thresholds for the level). With incorrect isotope selection for a one-point calibration, the calibration point for 100% will be calculated incorrectly.
2 Calibration Method

You can choose from the following calibration methods:

- **1-POINT**
  
  Use the 1-point calibration only if full calibration is not possible. In this method, an empty adjustment (level below the monitoring level) is required (Device Config ► Setup ► Cal Parameter ► Cal Points ► ReadIn ► Read Lower Point). Using additional inputs such as product density and measuring path (Device Config ► Setup ► Cal Parameter ► Product Conditions) the count rate for the full calibration (level above the monitoring level) is then determined automatically.

- **2-POINT**
  
  An empty calibration (level below the monitoring level) and a full calibration (level above the monitoring level) is required for a two-point calibration. Carry out empty calibration via Device Config ► Setup ► Cal Parameter ► Cal Points ► ReadIn ► Read Lower Point, full calibration via Device Config ► Setup ► Cal Parameter ► Cal Points ► ReadIn ► Read Upper Point.

💡 Tip

Since the full calibration is actually measured and not only calculated, a better display accuracy will be reached with the 2-Point setting.
3 Switch Function

- You can specify whether the limit switch is used as a High Alarm or as a Low Alarm. The switching direction affects the fail-safe function of the digital output (open collector). To output the alarm as a signal via the open collector, you have to set Digital Out Function in the I/O Setup menu (page 3-270) to LS ALARM.

You have the following setting options:

- **MAX**
  The alarm is triggered when exceeding the switching threshold (alarm threshold for the level) (High Alarm).

- **MIN**
  The alarm is triggered when falling below the switching threshold (alarm threshold for the level) (Low Alarm).

- **MAX + BUILD UP**
  The alarm is triggered if the switching threshold is exceeded (High Alarm). In addition, monitoring is performed which triggers an alarm if wall deposits\(^1\) (build-up) are detected. Prerequisite for correct function is that both the count rate for empty and the count rate for full was measured. During the measurement of the empty value it must be ensured that no build-up occurs.

4 Evaluation Mode

Specifies whether the settings for Time Const (time constant), Threshold (switching threshold) and Hysteresis (hysteresis) are calculated automatically and adjusted continuously (factory setting), or whether they can be manually set to a fixed value.

- **AUTO SET**
  This is the default setting which should ideally be maintained. It ensures that the above parameters are optimized and adjusted continuously and checked at every decay compensation.

- **MANUAL SET**
  Use this setting only if it is absolutely necessary for your application and if you are aware of the consequences of manual input of fixed values. Incorrect entries that jeopardize the switching reliability can be compensated for only partially in this mode.

**IMPORTANT**

With manual input (MANUAL SET), the decay compensation has to be taken into account. Therefore, you must choose the time constant so large that it is valid for years to come and will not lead to incorrect switching. See also Time Const.

In the default setting (AUTO SET), the switching reliability is checked as well in the daily decay compensation.

---

1. The function enables the early detection of wall deposits, i.e. before the reliable switching function is no longer guaranteed. The **BUILD UP** function, however, increases the time constant automatically and thus the reaction time.
5 Time Constant

Shows the current time constant. The time constant is calculated automatically (factory setting), but can also be manually set to a fixed value. The time constant smooths the output signal. Statistical fluctuations, as well as level fluctuations due to the process, e.g. by agitators, are smoothed. The value of the time constant corresponds approximately to the response time of the measurement. Depending on the setting in Evaluation Mode, either the calculated time constant is displayed (AUTO SET) or a time can be entered in seconds (MANUAL SET).

We recommend using the automatic calculation (AUTO SET) unless important reasons speak against it.

For manual input please keep in mind: The time constant must be sufficiently large to avoid incorrect switching. At the same time, however, an increase in the time constant will delay the reaction of the measurement to a level exceedance; therefore, the time constant should not be selected too large. A time constant of 20 seconds is a good choice for standard applications and correct source detector configurations (see also chapter 7.5).

Provided that with automatically calculated time constant a maximum time constant is not to be exceeded, you can specify a limit value via Max Time Constant, so that an alarm message is triggered when exceeding this limit value (Device Config ► Setup ► Signal Condition ► Source Exchange ► Max. Time. Constant, page 3-256).
6 Threshold
Displays the current switching threshold (alarm threshold for the level). The time constant is calculated automatically (factory setting), but can also be manually set to a fixed percentage value (Evaluation Mode: MANUAL SET). We recommend using the automatic calculation (AUTO SET) unless important reasons speak against it.

If the alarm for the switching threshold is triggered, the following signals are set:
- the current output goes to 4 or 20 mA
- Alarm State is ON
- the open collector switches

Tip
You can compare your settings for the switching threshold (alarm threshold for the level) with the optimal setting by switching to AUTO SET in the Evaluation Mode. Your manual entries will not be lost.

Please keep in mind when you enter a fixed value: The more you deviate from the optimum setting for the switching threshold, the greater the time constant that must then be selected.

7 Hysteresis
Shows the current hysteresis. The hysteresis is calculated automatically (factory setting), but can also be manually set to a fixed value (Evaluation Mode: MANUAL SET). The hysteresis lies symmetrically around the switching threshold and prevents switching back and forth, which would be triggered by fluctuations of the measured value.

8 ReadIn Time
You can specify over which period of time the count rate is read.

The statistical variation of the count rate is averaged over this time period. The longer it is, the better the mean value. A time period of 60s (default setting) is usually reasonable.
2.23 Product Conditions

Menu path: Device Config ▶ Setup ▶ Cal Parameter ▶ Product Conditions.

On this menu you enter the basic product-specific settings that need to be performed before calibration.

Entries for these parameters are required only in the following cases:

- For a 1-point calibration when full calibration is not possible.
- For containers with a gas pressure and when the calibration cannot be performed at the same gas pressure as during operation.
- Because for bulk material the limit switch has to switch at a specific bulk cone diameter.

**IMPORTANT**

Changes in this parameter group have an effect only when you call Calibrate (Device Config ▶ Setup ▶ Cal Parameter ▶ Calibrate, page 3-257).

1 Measuring Path

This setting is needed only when using the Calibration Method 1-POINT (Device Config ▶ Setup ▶ Cal Parameter ▶ Cal Settings, page 3-262), for applications with gas density compensation or in connection with Bulk Cone Diameter.

Enter the measuring path of the beam path in the product that is to be measured in mm. Generally, this corresponds to the inner diameter of the container.

2 Product Density

This setting is needed only when using Calibration Method 1-POINT (Device Config ▶ Setup ▶ Cal Parameter ▶ Cal Settings, page 3-262) or in connection with Bulk Cone Diameter.

For liquids you have to enter the liquid density in kg/m³, for bulk material, the bulk density. If you known the fluid density and the bulk density only approximately, then you have to enter the lowest expected value.

3 Bulk Cone Diameter

The setting is used to determine the switching point in bulk cone materials: In bulk cone materials the switching threshold should often lie at a specific bulk cone diameter.

Enter a value greater than 0 mm to calculate the switching threshold using the bulk cone diameter, provided that the measuring path (Measuring Path) and the product density (Product Density) are indicated.

Please note that the time constant can be very large if the bulk cone diameter is selected too small or too large.
4 Setup Gas Density

Use this parameter only if the gas density during calibration is different from the gas density under operating conditions. Using the gas density, a compensated count rate is then calculated from the count rate in Lower Cal Pt-Empty (Device Config ▶ Setup ▶ Cal Parameter ▶ Cal Points ▶ Lower Cal Pt-Empty), which you can read off under Op Lower Point.

Enter the gas pressure in kg/m³ which is present during calibration. Typically, this is 0 kg/m³.

Prerequisite for the correction are correct entries in the following menu items:

- Setup Gas Density
- Op Gas Density
- Measuring Path
- Nuclide

Gas pressure < 1 bar

Gas densities with a pressure below 1 bar are generally negligible. You may therefore enter 0 kg/m³.

Gas pressure > 1 bar

Determine the gas density under operating conditions very carefully in order to keep the error of the automatic compensation as small as possible. Better and more accurate would be the measurement of the empty count rate with gas and a gas density that is likely to be below operating conditions.

Gases with hydrogen

If hydrogen is present in the gas, then the absorption of the Gamma radiation is greater than would be expected by the actual gas density. This effect can be compensated by increasing the gas density to be entered. If you cannot determine the increased absorption, please contact BERTHOLD TECHNOLOGIES.
5 Op Gas Density

Enter the gas pressure in kg/m\(^3\) which is present during calibration. Use this parameter only if the gas density during calibration is different from the gas density under operating conditions. Using the gas density, a compensated count rate is then calculated from the count rate in **Lower Cal Pt-Empty** (Device Config ▶ Setup ▶ Cal Parameter ▶ Cal Points ▶ Lower Cal Pt-Empty), which you can read off under **Op Lower Point**.

Prerequisite for the proper correction are correct entries in the following menu items:

- Setup Gas Density
- Op Gas Density
- Measuring Path
- Nuclide

**Gas pressure <1bar**

Gas densities with a pressure below 1 bar are generally negligible. You may therefore enter 0kg/m\(^3\).

**Gas pressure > 1 bar**

Determine the gas density under operating conditions very carefully in order to keep the error of the automatic compensation as small as possible. Better and more accurate would be the measurement of the empty count rate with gas and a gas density that is likely to be below operating conditions.

**Gases with hydrogen**

If hydrogen is present in the gas, then the absorption of the Gamma radiation is greater than would be expected by the actual gas density. This effect can be compensated by a increasing the gas density to be entered. If you cannot determine the increased absorption, please contact BERTHOLD TECHNOLOGIES.

6 Op Lower Point

If you use the gas density compensation, the count rate which would be obtained under operating conditions is displayed here. The value shown cannot be changed and depends on:

- **Count rate in Lower Cal Pt-Empty**
- Setup Gas Density
- Op Gas Density
- Measuring Path
- Nuclide
2.24 Adapt Calibration

Menu path: Device Config ▶ Setup ▶ Cal Parameter ▶ Adapt Calibration.

This menu allows you to activate calibration data that have been saved at an earlier time. The data is automatically decay-compensated.

The function is used, for example, when replacing the detector electronics to take it into operation afterwards with the original parameter set.

1 Restore Upload  
Restore upload has a similar function as Calibrate, but considers a validity date, for example, of older calibration data and automatically performs a decay compensation.

First, you have to save the original set of parameters in the HOST or the HART® Communicator as off-line parameters. The off-line parameters can then be restored to the detector. Then enable this parameter set with Restore Upload. The validity date (Restore Date) of the calibration, which is contained in the off-line parameters, will automatically be compared with the current date in the detector and the calibration count rate is adjusted accordingly.

2 Restore Date  
Restore Date contains the validity date that is used for the function Restore Upload. It can be loaded with the calibration data set or entered by hand.

2.25 I/O Setup

Menu path: Device Config ▶ Setup ▶ I/O Setup.

This menu allows you to set the analog and digital inputs and outputs and the interfaces.

1 Current Output  
Opens the menu with the settings for the current output (page 3-271).

2 Digital Output  
Opens the menu with the settings for the digital output (page 3-273).

3 Digital Input  
Opens the menu with the settings for the digital input (page 3-276).

4 HART Interface  
Opens the menu with the settings for the HART® interface (page 3-277).
2.26 Current Output

Menu path: Device Config ► Setup ► I/O Setup ► Current Output.

1 Current Loop Monitoring

- Enable or disable the monitoring of the 4–20mA current signal. Monitoring checks whether the set current is actually flowing in the current loop, and signals an error if any deviation is detected.

You have the following setting options:

- **ENABLED**
  - Monitoring is enabled (default setting).
  - Unless there are compelling reasons, you should keep this setting. The setting is automatically enabled when the Safety Mode is selected.

- **DISABLED**
  - Monitoring is disabled. The HART Communicator outputs a corresponding message.

**Tip**

In case of a gross deviation or loose contact, monitoring may have the effect that the fault condition can only be reset by a software reset. The software reset menu can be done in the menu Service (Device Config ► Setup ► Service ► Reset Device, page 3-278) or by turning the power supply off and then on again.

2 Loop Alarm Type

- Here you specify the fault current, i.e. the current that is to be output in case of error.

**IMPORTANT**

*In Safety Mode, only the settings High and Low are possible.*

You have the following setting options:

- **High**
  - In case of error the current output is set to >21mA.

- **Low**
  - In case of error the current output is set to >3.6mA.

- **Hold Last Value**
  - In case of error the current output holds the last measured value.

- **Value**
  - In case of error, the current output is set to the current value, which is set in Error Current Value.
3 Error Current Value

Here you can define the fault current in mA, if you have chosen **Value** at **Loop Alarm Type**. With the settings **High** and **Low** the corresponding current values (>21mA/<3.6mA) are displayed.

4 Current Lower Limit

Lower limit of the current range for the 4-20 mA current output.

For adjustment purposes or to safely identify an under measuring range condition, the current range available for the measurement signal is extended beyond the standard range of 4-20 mA. According to Namur specifications (NE 43), the lower current value must, however, not be less than 3.8 mA. However, you can define the minimum value in the range from 3.8 to 4 mA.

5 Current Upper Limit

Upper limit of the current range for the 4-20 mA current output.

For adjustment purposes or to safely identify an over measuring range condition, the current range available for the measurement signal is extended beyond the standard range of 4-20 mA. According to Namur specifications (NE 43), the upper current value must, however, not be higher than 20.5 mA. However, you can define the minimum value in the range from 20 to 20.5 mA.

6 D/A trim

This menu item allows you to adjust the current output. You will need a power meter which is looped into the current loop. In a menu-guided process, 4mA and 20mA are defaulted one after the other. You are prompted to enter the actual value displayed on your current meter.

**IMPORTANT**

The impedance on the current output must always be lower than 500ohms, but at least 250ohms.
2.27 Digital Output

Menu path: Device Config ► Setup ► I/O Setup ► Digital Output.

The digital output provides a wiring for different signals. Without additional I/O cards, the digital output is an open collector which is switched fail safe. This means that the transistor is conductive, as long as no alarm is reported and is blocked if an alarm is signaled. For more information on the digital output, see Volume 2, chapter 3, "Electrical Installation", page 2-171.

**IMPORTANT**

If you use the setting NORMAL in the menu Error Handling (Device Config ► Setup ► Signal Condition ► Signal Parameter ► Error Handling), only errors are reported via the current output. Alerts can then be received only through one of the following signal outputs:
- via the digital output as a binary signal
- via the HART® signal as a text message

1 Digital Out Function

- Here you can define the switching function of the digital output. You have the following setting options:
  - **LS ALARM**
    The alarm is triggered when the threshold (alarm threshold for the level) is exceeded or fallen short of, i.e. it reacts in parallel with the current output signal. The switching behavior is dependent on the switching function selected at Switch Function (Device Config ► Setup ► Cal Parameter ► Cal Settings ► Switch Function, page 3-262). If an error occurs, the digital output goes to alarm.
  - **DET. TEMP**
    The alarm is triggered when the detector temperature is below or above the permissible temperature range. The temperature range is specified in Sensor Temperature (Device Config ► Setup ► I/O Setup ► Digital Output ► Temp. Threshold Settings, page 3-287).
  - **HOLD**
    The alarm is triggered when the measurement is on hold, i.e. the measured value is frozen. This can be caused, for example, by the digital input or by RID.
  - **WARNING + ERROR**
    The alarm is triggered when the detector signals an error or reports a warning. In chapter 8 on page 3-335 you find a list of possible causes and troubleshooting procedures.
• **BUILD UP**
  The alarm is triggered when wall deposits or product deposits were detected on the container wall, which could affect the switching behavior of the measurement. The function is only available if you have chosen **MAX + BUILD UP** at **Switch Function** (Device Config ► Setup ► Cal Parameter ► Cal Settings ► Switch Function, page 3-262).

  **Tip**
  The Build-up alarm is output even when you select **WARNING + ERROR**.

• **RAD. INTERFERENCE**
  The alarm is triggered when interference radiation is detected. The function can be selected only if you have selected **RAD. INTERFERENCE** at **Response Mode** (Device Config ► Setup ► Signal Condition ► Radiation Interference ► Response Mode, page 3-253).

  **Tip**
  The alarm for **RAD. INTERFERENCE** is output even when you select **WARNING + ERROR**.

2 Digital Out State
Displays the current value of the digital output. If the test mode is active, then the test value is displayed. The following functions can be displayed:

- **Normal**
- **Alarm**

3 Temp. Threshold Settings
Opens the menu for the temperature-related settings (page 3-275).
2.28 Temp. Threshold Settings

1 Temp. Upper Limit

Upper limit value for the detector temperature.

An alarm may be signaled via the digital output if this temperature is exceeded. To do this, set the digital output to the function DET. TEMP. The alarm is also signaled when the minimum detector temperature (Temp. Lower Limit) is not reached.

Tip
You can use this feature, for example, as a pre-alarm, for the detection of an over-temperature, or control the cooling water cycle of the detector so that the cooling water flow is started at elevated temperature.

2 Temp. Lower Limit

Lower limit value for the detector temperature.

An alarm may be signaled via the digital output if this temperature is not reached. To do this, set the digital output to the function DET. TEMP. The alarm is also signaled when the maximum detector temperature (Temp. Lower Limit) is exceeded.

Tip
You can use this function as a pre-alarm for under-temperature, so that a possibly connected cooling water system does not freeze, or a heater is turned on.

3 Temp. Hysteresis

Hysteresis for the temperature limit values.

4 Temp. Unit

Unit for the detector temperature. The temperature can be indicated in Fahrenheit or in Celsius.

5 Device Temp.

Displays the temperature inside the detector.
2.29 Digital Input

Menu path: Device Config ► Setup ► I/O Setup ► Digital Input.

The digital input can be controlled by the process control system. The reaction occurs when a short circuit of the input takes place; the signal must be bounce-free.

**IMPORTANT**

If Safety Mode is enabled, the digital input is disabled automatically.

The digital input is only available as an option. It is available for versions with HART® signal, but not for detectors with fail-safe signal output.

1 Digital In Function

Here you can define the switching function of the digital input. You have the following setting options:

- **OFF**
  The digital input is disabled.

- **HOLD**
  The measurement is frozen (hold mode) as long as the contact is closed.

- **EMPTY**
  Runs an empty calibration. The input must be closed only briefly in order to start the process.

- **FULL**
  Runs a full calibration. The input must be closed only briefly in order to start the process.

2 Digital In State

Indicates whether the input is open or closed.
2.30  HART Interface

Menu path: Device Config ► Setup ► I/O Setup ► HART Interface.

1 Poll Addr

Shows the current polling address. The address can be set with Set Poll Address.

2 Set Poll Address

Allows you to set the polling address for multidrop operation.

Enter only a polling address > 0 if the multidrop mode is used to operate several HART® devices at one current loop. Otherwise, leave the value at 0, since with a polling address > 0 the current output has no function anymore.

To use the multi-drop mode the current output must be passive (sink mode).

Multidrop mode

The host terminal uses the multidrop mode to identify the field device if more than one HART® device is connected to the same HART® loop. From HART® 6, up to 63 HART® devices can be interconnected in one HART® loop. Each device must have a different polling address between 1 and 63.

If an address is set which is higher than 0, the Multidrop Mode is selected automatically and the current output is switched to a fixed current value of 4 mA. Then only the digital HART® communication will be available.

IMPORTANT

For safe HART® communication, the current output must have a minimum impedance of 250ohms and a maximum impedance of 500ohms.

3 Num Req Preams

Display of the requested preambles during communication between detector and communicator to initiate the start of communication. The value is set to 3 and cannot be changed.

4 Num Resp Preams

Number of returned preambles during communication between detector and communicator to initiate the start of communication. The default value is 5. At a higher number, the communication is slowed down slightly. The setting range is 5 to 20.
2.31 Service

Menu path: **Device Config ➤ Setup ➤ Service**.

This menu allows you to access various test functions, enter the license key and perform a detector reset.

1 PMT

Opens the menu showing the anode current of the photomultiplier (PMT) (*page 3-279*).

2 Sensor Temperature

Opens the menu showing the various detector temperatures (*page 3-279*).

3 Test

Opens the menu with the various test functions (*page 3-280*).

4 Plateau

Opens the menu for the plateau measurement and display of the plateau values (*page 3-284*).

5 License Key

The license key allows you to enable the detector for other applications (level, density). You can get a license key through your sales partner or directly from BERTHOLD TECHNOLOGIES GmbH & Co. KG. Write down your license key in your operating manual. Each detector has its own license key.

6 Reset Device

The menu offers you several ways to reset the detector or certain functions:

- **SW RESET** (Software Reset)
  
  Starts the detector new. The function corresponds to the switching off and on of the supply voltage.

- **FACTORY RESET**
  
  Resets most settings to factory default. Some settings, such as the adjustment of current output and the license key will be preserved.
2.32  PMT

Menu path: Device Config ▶ Setup ▶ Service ▶ PMT.

This menu allows the qualification of the photomultiplier (PMT) after consultation with BERTHOLD TECHNOLOGIES. Increased current values at the multiplier indicate a strong radiation levels (caused, for example, by weld testing), or a defect at the PMT, or the HV control.

1 HV Live
Displays the current HV (high voltage) at the photomultiplier. If HV Mode is set to AUTO (normal operation), the values in HV Live must change, viewed over several seconds.

2 HV Feedback
Display of the read back HV value which is actually present at the multiplier. The display is used to control the HV.

3 Meas CH CPS
Count rate in the measuring channel.

4 Control CH CPS
Count rate in the control channel.

5 Auxiliary CH CPS
Count rate in the auxiliary channel.

6 PMT Current
Displays the current anode current.

7 PMT Current Max
Display of the stored maximum value for the multiplier tube current (PMT Current).

8 Reset Current Extrema
Clears the maximum value of the multiplier tube current (PMT Current Max).

2.33  Sensor Temperature

Menu path: Device Config ▶ Setup ▶ Service ▶ Sensor Temperature.

On this menu you can view the various detector temperatures.

1 Device Temp.
Displays the current detector temperature. The temperature is measured in the electronics of the detector.

2 Device Temp. Min
Display of the lowest temperature measured.

3 Device Temp. Max
Display of the highest temperature measured.

4 Reset Temp Extrema
Clears the stored values in Device Temp. Min and Device Temp. Max.
2.34 Test

Menu path: Device Config ▶ Setup ▶ Service ▶ Test.

These menus allow you to perform various tests on the detector. All tests have a direct influence and are not delayed by the time constant.

If you lock the device with the password or if the Safety Mode is enabled, all test settings will be disabled automatically.

1 Test Settings
Opens the menu offering various test options for the detector (page 3-280).

2 I/O Test Settings
Opens to the menu offering various test options for the digital inputs and outputs (page 3-282).

2.35 Test Settings

Menu path: Device Config ▶ Setup ▶ Service ▶ Test ▶ Test Settings.

This menu allows you to check your calibration setting by simulating the measurement signal.

1 Level Mode
Here you can check if the process value is correctly transmitted from the field device to the process control system.

To simulate a level reading, you have to:
1. Enter a level value at Level.
2. Select FIXED VALUE at Level Mode.

IMPORTANT
After the test, do not forget to switch from FIXED VALUE back to NORMAL; otherwise your measurement signal will remain frozen at this value.

2 Level
 ◄ Enter the value to be simulated.

To enable the simulation, you must set FIXED VALUE at Level Mode.
3 Cps Average Mode

This item allows you to check whether your calibration is correct. Enter a count rate and then check the simulated level reading.

To simulate a level reading via a count rate, you have to:
1. Select **FIXED VALUE** at Cps Average Test.
2. Enter a count rate at Cps Average Mode.

**IMPORTANT**
*After the test, do not forget to switch from **FIXED VALUE** back to **NORMAL**; otherwise your measurement signal will remain frozen at this value.*

4 Cps Average Test

▶ Enter the value to be simulated.
To enable the simulation, you must set **FIXED VALUE** at Cps Average Mode.

5 Device Temp. Mode

Allows you to verify if over- or under-temperature is signaled via the digital output. Enter a test temperature and then check the signal at the digital output.

To check the digital output with a test temperature, you have to:
2. Select **FIXED VALUE** at Device Temp. Mode.
3. Enter a temperature value in Device Temp. Test.

**IMPORTANT**
*After the test, do not forget to switch from **FIXED VALUE** back to **NORMAL**; otherwise the temperature signaling will remain frozen.*

6 Device Temp. Test

▶ Enter a temperature value in order to test the digital output as a signal output for over- or under-temperature.
To enable the simulation, you must set **FIXED VALUE** at Device Temp. Mode.
2.36 I/O Test Settings

Menu path: Device Config ▶ Setup ▶ Service ▶ Test ▶ I/O Test Settings.

This menu allows you to perform various tests on the analog and the digital inputs and outputs.

1 Digital Out Mode

To enable the test, you have to:

1. Select **FIXED VALUE** at Digital Out Mode.
2. Enter **CLOSED** or **OPEN** at Digital Out Test State.

**IMPORTANT**

After the test, do not forget to switch from **FIXED VALUE** back to **NORMAL**; otherwise the signaling will be kept.

2 Digital Out Test State

- Choose **OPEN** or **CLOSED** to check the appropriate reaction at the digital output.

To enable the simulation, you must set **FIXED VALUE** at Digital Out Mode.

3 Digital In Mode

Allows you to simulate a signal at the digital input and examine its impact on the detector.

To enable the test, you have to:

2. Select **FIXED VALUE** at Digital In Mode.
3. Enter **CLOSED** or **OPEN** at Digital In Test State.

**IMPORTANT**

After the test, do not forget to switch from **FIXED VALUE** back to **NORMAL**; otherwise the signaling will be kept.

4 Digital In Test State

- Choose **OPEN** or **CLOSED** to check the appropriate reaction of the detector.

To enable the simulation, you must set **FIXED VALUE** at Digital In Mode.
5 Loop Current Mode

Indicates whether the current output is active or frozen. The following displays are possible:

- **ENABLED**
  The current output is active.

- **DISABLED**
  The current output is frozen.

The current output is frozen in the following cases:

- if it is set to fault current
- in multi-drop mode (**Set Poll Address**, see page 3-277)
- in test mode

6 Loop test

Allows you to selectively output current values at the current output. Thus you can check the correct function of the current output and the display value in the process control system. Enter the desired value in mA.

### 2.37 Plateau

Menu path: **Device Config ➤ Setup ➤ Service ➤ Plateau**.

This menu leads to the plateau measurement and to the display of the plateau values.

1 Plateau Measurement

Leads to the plateau measurement (**page 3-284**).

2 Plateau View

Enables the display of the plateau data in a table or as a plateau curve.

3 Plateau Information

General information on the plateau measurement.
### 2.38 Plateau Measurement

Menu path: Device Config ► Setup ► Service ► Plateau ► Plateau Measurement.

For information on how to perform a plateau measurement please refer to chapter 6.1, page 3-319.

1 HV Start
- Enter the HV start value in volts.

2 HV Stop
- Enter the HV stop value (end value of the measurement) in volts.

3 HV Step
- Enter the step size in volts, which should lie between the measuring points.

4 Meas. Time
Enter the length of time over which each measuring point should be averaged, for example 20 s.

5 HV Mode
The menu item offers the following options:

- **AUTO**
  Enables the automatic HV control. Set this operating mode for the normal measurement mode. This enables a temperature-stable operation of the detector.

- **MANUAL**
  This setting is typically used for testing purposes only. You can specify, for example, the provisional operating point of the detector. The specified voltage must, however, lie in the plateau.

  As soon as you enable **Manual**, the automatic HV control is switched off. The HV is then set to the value that was specified at HV Manual.

- **PLATEAU**
  Starts the plateau measurement. The measurement mode is exited and the plateau of the multiplier which is used in the detector is measured. The measurement is done with the settings defined in the menu items HV Start, HV Stop, HV Step and Meas. Time.

  At the end of the plateau measurement the detector automatically switches back to HV Mode: **AUTO** or **MANUAL**, depending on which mode was last set.

6 HV Live
Displays the current HV (high voltage) at the photomultiplier. If HV Mode is set to **AUTO** (normal operation), the values in HV Live must change, viewed over several seconds.

7 Cps Live
Displays the current count rate.
2.39 Plateau View

Menu path: Device Config ▶ Setup ▶ Service ▶ Plateau ▶ Plateau View.

This menu allows you to display the plateau data in a table or as a plateau curve.

1 Refresh Plateau
Updates the plateau table by loading the data from the detector.

2 Plateau Table
Shows the plateau data points in a table.

3 Plateau Curve
Shows the plateau data points in a curve.

2.40 Plateau Information

Menu path: Device Config ▶ Setup ▶ Service ▶ Plateau ▶ Plateau Information.

General information on the plateau measurement.

1 Plateau Date
Shows the date of the last plateau recording.

No plateau recording is available when the date 01/01/2000 is displayed.

2 Plateau Tab Entries
Displays the number of data points for the plateau measurement.

2.41 Meas Parameter

Menu path: Device Config ▶ Meas Parameter.

These menus show the currently valid measurement parameters.

1 Meas Data
Shows the menu with the currently measured values (page 3-286).

2 Meas Settings
Opens the menu showing the most important detector settings (page 3-287).

3 Build Up Alarm
Opens the menu showing the data for the build-up alarm (page 3-288).
2.42 Meas Data

Menu path: Device Config ➤ Meas Parameter ➤ Meas Data.

The menu shows the measured and automatically calculated measurement settings (parameters). The count rates are corrected daily at 09:01 h through the automatic decay compensation; the values, therefore, become smaller in the course of a few weeks.

1 Background

Shows the calibration value of the background radiation.

2 Lower Point

Displays the count rate of the lower calibration point (Lower Point).

3 Upper Point

Displays the count rate of the upper calibration point (Upper Point).

4 Time Const

Shows the time constant used to average the measured value.

To prevent that a maximum allowable time constant for your requirements regarding the measurement is exceeded, you can set a maximum value for the time constant in the Source Exchange menu, see page 3-255.

5 Threshold

Shows the center switching point in % where the alarm is output. Please note that the hysteresis lies symmetrically around the switching point, which in the case of a limit switch minimizes the possible switching back with statistical or process-related level fluctuations.

6 Threshold Cps

Shows the center switching point in cps where the alarm is output. It is calculated from the limit value in %.

7 Hysteresis

Shows the hysteresis that lies symmetrically around the switching point.
2.43 Meas Settings

Menu path: **Device Config ➤ Meas Parameter ➤ Meas Settings.**

1 Nuclide

Display of the isotope (nuclide) selected for the calibration. It must be the same as the source which is used at the measuring site.

- **Co-60**
- **Cs-137**
- **USER DEFINED**

This information controls the automatic decay compensation and must match the information on the type plate of the shielding.

2 Switch Function

You can specify whether the limit switch is used as a **High Alarm** or as a **Low Alarm**. The switching direction affects the fail-safe function of the digital output (open collector).

- **MAX**
  The alarm is triggered when exceeding the switching threshold (alarm threshold for the level) (High Alarm).

- **MIN**
  The alarm is triggered when falling below the switching threshold (alarm threshold for the level) (Low Alarm).

- **MAX + BUILD UP**
  The alarm is triggered if the switching threshold is exceeded (High Alarm). In addition, monitoring is performed which triggers an alarm if wall deposits (build-up) are detected.

3 Evaluation Mode

Specifies whether the settings for **Time Const** (time constant), **Threshold** (switching threshold) and **Hysteresis** are calculated automatically and adjusted continuously (factory setting), or whether they can be manually set to a fixed value.

- **AUTO SET**
  This is the factory setting. It ensures that the above parameters are optimized and adjusted continuously and checked at every decay compensation.

- **MANUAL SET**
  Manual setting. Incorrect entries that jeopardize the switching reliability can be compensated for only partially in this mode.

4 Cal Method

Indicates which type of calibration was last performed:

- **1-POINT**
- **2-POINT**
2.44 Build Up Alarm

Menu path: Device Config ► Meas Parameter ► Build Up Alarm.

This function is used for application-oriented service and is intended for max.-switch applications only. It detects wall deposits or gas density increases early, which affect the limit switch function.

To this end, additional thresholds are determined in the background. If the level does not keep a sufficient distance to these thresholds, then a warning is output, which is reported as an alarm via the digital output. The digital output has to be set accordingly.

1 BU Alarm
Indicates if the function Build-up alarm is enabled or disabled.

2 BU Level
Shows the BU Level in %. The BU Level is calculated parallel to the normal level with a higher time constant.

3 BU Threshold
Display of the limit value for build-up alarm in %. The limit value is calculated automatically.

Build-up alarm is triggered in the following cases:
1. If the level is empty and BU Threshold is exceeded.
2. When the level goes from full to empty and the switching threshold is not fallen below.

4 BU Hysteresis
Display of the hysteresis for BU Threshold in %.

5 BU Time Constant
Display of the time constant which is used to average the measurement value at BU Level. The time constant for the build-up alarm is determined automatically.

6 BU Delay Time
Display of the response time in seconds until a build-up alarm is output. The time period is set via Device Config ► Setup ► Signal Condition ► Build Up Alarm, see page 3-256.
2.45  Access

Menu path: Device Config ► Access.

On this menu you can enter the password, enable write protection to prevent configuration changes and activate the safety mode.

1 Password

Enter a password to protect the detector against unauthorized access. Then access to editable parameters is disabled. To undo the protection again, you must enter the password again.

You can choose any password you want; it may comprise a maximum of 8 characters or digits.

Possibly activated test settings are reset when enabling password protection.

💡 Tip
Write down your password to be able to unlock the detector later. Please contact BERTHOLD TECHNOLOGIES if you lose your password.

2 Write Protect

Indicates whether the detector is protected against changes in the settings (parameters).

- **NO**
  The detector is not write protected, so that the settings can be edited.
- **YES**
  The detector is write protected; settings cannot be edited, but they can still be displayed.

3 Safety Mode

Indicates whether the safety mode is enabled:

- **ON**
  Safety mode is enabled.
- **OFF**
  Safety mode is disabled.
**4 Safety ON**

The safety mode has to be enabled for safety-relevant applications.

**IMPORTANT**

Activation of the Safety Mode does not automatically turn a detector into a device that can be used in a SIL safety circuit. Only a system marked SIL on the type plate can be used with the SIL data in the safety manual in a safety circuit. SIL-certified detectors are marked with an "S" in the LB number key LB 480-xx-xx-xx-xx-xx-Sx-x.

In safety mode, safety-limiting values are set to a safety-compatible setting. In addition, you will be prompted to protect the detector with a password.

The following settings must be set to enable the Safety Modus:

- Current loop monitoring: **Current Loop Monitoring = ENABLED**
- HV Mode: **HV Mode = AUTO**
- All test settings: **Test Settings = NORMAL**
- Digital In Function: **Digital In Function = OFF**
- Multidrop: **Poll Addr = 0**

When enabling the Safety Modus, the parameter Error Handling is automatically set to **SENSITIVE**.

**IMPORTANT**

**HV default** must have the correct value (operating point).

If you have changed the factory-set HV value, you have to determine it again. Determine the operating point and enter this value in HV Default (Device Config ► Setup ► Sensor Configuration ► Sensor Settings ► HV Default, page 3-249). See also chapter 6.1, "Plateau Measurement", page 3-319.

**Tip**

The operating point in new detectors is usually between 400 to 900 V. If you get a different value, please contact BERTHOLD TECHNOLOGIES or your local representative.

**5 Safety OFF**

Disables the safety mode. You need the password to disable the safety mode.

If you disable the safety mode, the following settings are made automatically:

- **Write Protect** is set to **OFF**
- **Error Handling** is set to **NORMAL** (see page 3-251)

**6 Lock Device Status**

Indicates whether the detector is enabled or disabled for access to the HART® interface by other users.

**7 Lock/Unlock Device**

Locks or unlocks the detector to prevent access by other users to the HART® interface.
2.46 Identification

Menu path: Device Config ► Identification.
This menu shows various detector parameters, such as model, device ID, software and hardware revision.

1 Location
Opens the menu showing information about the tag (page 3-291).

2 Device Information
Opens the menu showing information about the detector (page 3-292).

3 Device Revision
Opens the menu showing the hardware and software revisions (page 3-292).

2.47 Location

Menu path: Device Config ► Identification ► Location.
This menu shows information about the tag.

1 Tag
Shows the tag number. You can edit information, any text is possible. Up to 8 characters.

2 Long tag
Shows the tag number. You can edit information, any text is possible. Up to 32 characters.

3 Descriptor
Shows a tag description. You can edit information, any text is possible.

4 Message
Shows a message. You can edit information, any text is possible.
2.48 Device Information

Menu path: Device Config ▶ Identification ▶ Device Information.

This menu shows information about the detectors.

1 Device Type
Shows the model name of the SENSseries. This information cannot be edited by the user.

2 Device Id
Identification number of the detector. It shows the specific HART® device number. This information is set up by BERTHOLD TECHNOLOGIES and edited be changed by the user.

3 Manufacturer
Shows the manufacturer's name. This information cannot be edited by the user.

4 Final Assembly Num
Number for identification of the detector.

2.49 Device Revision

Menu path: Device Config ▶ Identification ▶ Device Revision.

This menu shows the hardware and software revisions.

1 Universal Rev
Shows the revision of the specific universal HART® command set.
For the SENSseries you need the Universal Commands for HART® 6 or higher. This requires that the 375 Field Communicator of the Emerson Electric Co. or a compatible model is used which supports enhancements.
If the Communicator has a lower version than HART® 6, then the so-called Generic DD will be started. The Generic DD does have a HART®-specific command set, but this does not sufficient for the SENSseries.

2 Field Dev Rev
Shows the compatibility of the detector with DD on the Communicator. This number, e.g. 2, indicates that DD Revision 2 is necessary which supports the full functional range of the detector. See also chapter 7.6, page 3-331.

3 Software Rev
Displays the software revision (embedded software). This information depends on the currently installed firmware and cannot be changed.

4 SW Revision
Software revision with presentation according to NAMUR.

5 SW Revision Date
Date of the software revision.

4 Hardware Rev
Shows the hardware revision. This information is set up by BERTHOLD TECHNOLOGIES and edited be changed by the user.
2.50 Diagnostic

This menu provides status and error information and allows you to view the error logs and setting changes logs (parameter changes).

Tip
In chapter 8 on page 3-335 you find a list of possible causes and troubleshooting procedures.

1 Operating Status
Opens the menu showing the operating status (page 3-289).

2 Log
Opens the menu showing the logs for error and setting changes (page 3-295).

3 Safety
The status of all settings listed here must be OFF when you have enabled Safety ON (Device Config ➤ Access, page 3-289).

4 Error Status 100 … 907
Here you can check the status of all error messages that are possible in the detector.
- OFF = error free
- ON = an error is indicated

2.51 Operating Status

Menu path: Diagnostic ➤ Operating Status.

1 Device Status
Displays the current device status (standard HART® command).

2 Ext dev status
Shows the extended device status (standard HART® command, page 3-294).

3 Device Variables Status
Opens the menu showing the status of the detector variable (standard HART® command, page 3-294).

4 Config Change Status
Opens the menu showing information on the parameter changes (page 3-295).

5 Lock Dev Status
Indicates to what extent the device is locked against access to the HART® interface by other devices.
- Device is Locked
- Lock is Permanent
- Locked by Primary Master

6 Error Status
Opens the menu showing in the operating status of the measurement (page 3-296).
2.52  Ext dev status

Menu path: Diagnostic ► Operating Status ► Ext dev status.
Displays the current extended device status (standard HART® command).

- **Maintenance required**
  The extended "Maintenance Required" is not used.

- **Device variable alert**
  This status is signaled if any of the following conditions exist:
  - Primary Variable Out Of Limits
  - Non-Primary Variable Out Of Limits
  - Process Data Status\(^1\) of a device variable is not in the status GOOD
  - Limit Status\(^1\) of a device variable is not in the status NOT_LIMITED

- **Critical Power Failure**
  Not used
  (Only applicable to rechargeable battery or battery-operated devices.)

2.53  Device Variables Status

Menu path: Diagnostic ► Operating Status ► Device Variables Status.

1 Level Data Quality
Indicates the quality of the main variables (standard HART® command).

2 Level Limit Status
Indicates whether the limits of the main variables were reached (standard HART® command).

---

1. Process Data Status and Limit Status are included in the Device Variable Status.
### 2.54 Config Change Status

Menu path: Diagnostic ► Operating Status ► Config Change Status.

1 **Modification Counter**  
Shows the number of parameter changes that were made since the last Factory Reset.

2 **Reset Modification Flag**  
Resets the modification flag under Device Status.

### 2.55 Lock Device Status

Menu path: Diagnostic ► Operating Status ► Lock Dev Status.

Indicates to what extent the device is locked against access to the HART® interface by other devices.

- Device is Locked
- Lock is Permanent
- Locked by Primary Master
2.56 Error Status

Menu path: Diagnostic ▶ Operating Status ▶ Error Status.

1 Meas Setup Status

Displays the status of the calibration parameters. The status is updated after each decay compensation (at 09:01 h) and after each date change. Provides information on whether the measurement works safely, or whether incorrect switching is possible due to the current setting. One of the following status messages is displayed:

- **0-OK**
  The current calibration is OK.

- **1-ERROR BACKGROUND**
  The count rate of the background radiation is higher than that for the calibration points for empty or full (Lower Cal Pt-Empty or Upper Cal Pt-Full).

- **2-ERROR CALIBRATION POINT**
  The empty count rate is lower than the full count rate (Lower Cal Pt-Empty < Upper Cal Pt-Full).

- **3-ERROR THRESHOLD / TIME CONSTANT**
  The switching threshold (Threshold) is too close to one of the calibration points for empty (Lower Cal Pt-Empty) or full (Upper Cal Pt-Full) or the time constant was selected too small for the manual calibration. The error also occurs when the time constant exceeds 999 s.

- **4-ERROR TC MAX**
  The time constant (Time Constant) has a higher value than the maximum time constant (Max Time Constant, page 3-255).

- **5-ERROR BU TC**
  The time constant for the build-up alarm is above 14,400 seconds. This is either because the difference between empty count rate and full count rate is too low (Lower Cal Pt-Empty ≈ Upper Cal Pt-Full) or the limit value is too close to one of the calibration points for empty (Lower Cal Pt-Empty) or full (Upper Cal Pt-Full).

- **6-DATE ERROR**
  A date is still set to the default value of 1.1.2000. At Calibrate, check the Date parameter. At Restore, check the date in Restore Date.

- **7-CHECK ERROR**
  The status of the calibration parameters could not be fully verified. In this case, repeat the calibration. If the error occurs again, replace the detector, at least the detector electronics.
2 Operating Mode

Displays the operating status of the measurement. One of the following status messages is displayed:

- **RUN**
  The measurement is in the normal measurement mode.

- **WARNING**
  A warning of error category 2 is displayed and the following steps are carried out:
  - entry in the error log (the error is stored in the error memory)
  - the error will be reported digitally via HART®
  - the error is reported binary via the digital output (Digital Out) if this output has been set to **WARNING + ERROR** (see chapter 2.27, page 3-273)

If the error is no longer displayed in **Active Error**, you can check the error log (**Device Config** ▶ **Diagnostic** ▶ **Log**, page 3-295). In chapter 8 on page 3-335 you find a list of possible causes and troubleshooting procedures.

- **ERROR**
  An error of error category 1 is displayed and the following steps are carried out:
  - entry in the error log (the error is stored in the error memory)
  - the error will be reported digitally via HART®
  - the error is reported binary via the digital output (Digital Out) if this output has been set to **WARNING + ERROR** (see chapter 2.27, page 3-273)
  - the fault current goes to >21mA.

If the error is no longer displayed in **Active Error**, you can check the error log (**Device Config** ▶ **Diagnostic** ▶ **Log**, page 3-295). In chapter 8 on page 3-335 you find a list of possible causes and troubleshooting procedures.
- **SHUTDOWN**
  A serious error of error category 0 is displayed and the following steps are carried out:
  - entry in the error log (the error is stored in the error memory)
  - the error will be reported digitally via HART®
  - the error is reported binary via the digital output (Digital Out) if this output has been set to **WARNING + ERROR** (see chapter 2.27, page 3-273)
  - the fault current goes to >21mA.
  - the measurement is stopped.
  The error remains active until it is eliminated and a reboot or software reset has been carried out. If the error does not disappear after restart (power off and then on, or software reset, page 3-278), then the detector must be replaced.

- **HOLD**
  The measurement is in the hold state, which means that the measured value and the current output signal are frozen. This status can occur under the following conditions:
  - the plateau recording is running
  - interference radiation is detected
  - the digital input (option) is shorted

- **TEST**
  A test value has been enabled in the menu **Service ► Test** (page 3-280).

### 3 Error Code
Indicates if an error message is present.

If no error is present, then "0" is displayed here.

An error message is displayed with a three digit number. The cause of the error and suggestions for correcting the error are described in chapter 8, **Error Handling**.

### 4 Acknowledge Error
Acknowledges the currently pending error.
2.57 Log

This menu provides information about the history of the error messages and parameter changes. Up to 25 events can be entered.

1 Error Log
   Opens the menu displaying the errors that have occurred.

2 Modification Log
   Opens the menu showing the history of the settings made.

2.58 Error Log

Menu path: Diagnostic ▶ Log ▶ Error Log.

Update the error log by selecting Refresh Error Log before you select one of the following menu items. Otherwise, no or only old entries may be displayed.

Tip
In chapter 8 on page 3-335 you find a list of possible causes and troubleshooting procedures.

1 Refresh Error Log
   Updates entries in the error log table.

2 Error Log Table
   The last 25 errors are displayed in a table. The table contains the error code and the time the error occurred. The prerequisite is that the date and time were set correctly.

3 Reset Error Log
   Deletes all entries in the error log.

4 Error Code
   Indicates if an error message is present.
   If no error is present, then "0" is displayed here.
   An error message is displayed with a three digit number. The cause of the error and suggestions for correcting the error are described in chapter 8, Error Handling.

5 Acknowledge Error
   Acknowledges the currently pending error.
2.59 Modification Log

Menu path: Device Config ▶ Diagnostic ▶ Log ▶ Modification Log.

Update the modification log by selecting Refresh Error Log, before you select one of the following menu items. Otherwise, no or only old entries may be displayed.

1 Refresh Modification Log
   Updates the modification log.

2 Modification Log Table
   The last 25 modifications are displayed in a table. The table includes the old and the new parameter value and the time the change was made. The prerequisite is that the date and time were set correctly.

3 Reset Modification Log
   Deletes all entries in the modification log.
Getting Started via the HART® Communicator

The measuring system SENSseries LB 480 is compatible with the 375 Field Communicator (HART® Communicator, HART = Highway Addressable Remote Transducer) of the company Emerson Electric Co.. Other HART® compatible communicators may also be used, provided they support Enhancements. The HART® Communicator Model 275 by Emerson Electric Co. cannot be used.

Make sure before commissioning that
- the detector is not damaged,
- the detector is properly installed,
- the connections have been carried out properly,
- the cables are properly inserted,
- unused cable entries are sealed with plugs certified according to Directive 94/9/EC,
- the cover is tight,
- the dummy plugs and cable glands or conduits are tight.

The measuring system can be taken into operation either via the HART® Communicator or via a PC and the SIMATIC PDM software. Basically, the procedure for getting started is nearly identical for both versions. The difference is only the interface through which the measuring system communicates.

This chapter describes how to take the measuring system into operation via the HART® Communicator. Previous knowledge of the functionality of the HART® Communicator used is assumed.

### 3.1 Steps for Getting Started

Quick Guide to Calibration

Prerequisites

- The detector is installed and is supplied from the mains.
- The factory setting of parameters have not been changed yet. Otherwise, perform a Factory Reset (see chapter 5.1.1).
- The user is familiar with the basic calibration of a radiometric measurement.
- Communication with the HART® Communicator is established.

The following calibration is based on a one-point calibration, which requires only an empty calibration.

💡 Tip
Set the date and time when the error message 105 appears.

- Select the menu item Quick Start: Device Config ▶ Setup ▶ QuickStart.

QuickStart Menu

<table>
<thead>
<tr>

<td>page 3-243</td>
<td></td>
</tr>
</tbody>
</table>

Step 1 - Date/Time
- Check and update the date.
- Check and update the time.

Step 2 - Setup
- Select Nuclide: Cs-137 or Co-60 (see type plate of the source shielding).
- Select Calibration Method 1-POINT.
- Select Switch Function MAX or MIN.
Step 3 - Product Conditions

- **Measuring Path:** Enter the measuring path in the product, usually the inner diameter of the container.
- **Product Density:** Enter the bulk density of the product; with varying bulk density, use the smallest value.

Step 4 - Calibration Points

At the CrystalSENS you can skip the following item *Background*, unless the measurement is safety-relevant.

**Background**

The source shielding is not mounted at the measuring point, but at least it is adequately shielded (see chapter 7.1, page 3-323).

- Select ReadIn *BACKGROUND* and wait until the measurement time is over.

**Empty calibration**

Source is mounted and beam path open (see chapter 7.2, page 3-325). The tank is empty or the level below the limit value.

- Select ReadIn *LOWER-PT* and wait until the measurement time is over.

**Calibration**

- Select Calibrate + Auto Set.

The message *0-OK* must be displayed, otherwise correct the calibration error as per the error message and reselect Calibrate + Auto Set.

On the following pages you can find detailed calibration instructions.

---

**Tip**

Always carry out a test calculation after every calibration. This will ensure that your calibration data are plausible and the detector is set correctly (see chapter 2.35, page 3-280, *Cps Average Mode* and *Cps Average Test*).
Calibration

Errors in the calibration or in the parameter setting can lead to false results. This may possibly lead to loss of production, or to damage in the system.

For testing, we recommend using the test settings in the Service menu to simulate the calibration points.

A test run, ideally under operating conditions, will give you a high level of safety that your calibration is accurate. The entire measuring range has to be covered in this test run.

Basically we recommend to have commissioning carried out by the BERTHOLD TECHNOLOGIES service.

---

**Prerequisites for calibration with the HART® Communicator**

- The detector is installed correctly and is powered from the mains (see *Volume 2, chapter 2* and *chapter 3*).
- The HART® Communicator is connected to the current loop.
5.1 Preparing Calibration

For correct calibration of the measuring system, you have to ensure that the detector and basic settings are correct.

- Turn the HART® Communicator on.
  After power on, the Start menu appears.

Tip
Push **HOME** to return from any level back to the Start menu.

If the detector has been in stock for a long time, it may happen that the internal clock no longer displays the current date. In this case, the error message *105 Real time clock not valid* is displayed. Update the date and time to reset the error message (see chapter 2.13, page 3-246).

If you are sure that the detector and basic configuration are correct, you can start with the calibration of the measuring system immediately as described in chapter 5.2.

Otherwise proceed as follows:

- If the device is still locked with a password, undo the password protection (see page 3-289).
- Reset the detector to factory defaults (see page 3-307)
- Adjust the value for HV default (see page 3-307). This is usually not necessary, since the detector is factory-calibrated.
5.1.1 Reset SENSseries to Factory Settings

If the Start menu is not already displayed, push HOME to go to the Start menu.

- Select Device Config ➤ Setup ➤ Service ➤ Reset Device.
- Select FACTORY RESET and confirm the security prompt.

After successful reset, the message Device is reset! appears.
- Now turn the HART HART® Communicator OFF and ON again.

The parameters in the detector are now again identical with the factory setting (delivery state).

5.1.2 Adjusting the HV Default

HV Default has already been determined and set by BERTHOLD TECHNOLOGIES. If this value deviates during the first commissioning by more than 5% from HV Live, then you have to adjust HV Default new.

The adjustment of HV Default is only successful if the current count rate in the CrystalSENS is at least at 300 cps. With SuperSENS and UniSENS the count rate is irrelevant.

If the Start menu is not already displayed, push HOME to go to the Start menu.

- Select Device Config ➤ Setup ➤ Sensor Configuration ➤ Plateau ➤ Sensor Settings .
- Select HV Mode AUTO, if this is not already set.
- Save the changes with SEND.
- Wait until the HV value (HV Live) has been adjusted.

This takes about 2 minutes in the CrystalSENS and 30 minutes in the SuperSENS and UniSENS.

- Read off the value HV Live.
- Enter the value read-off at HV Default.
- Save the changes with SEND.

This completes the adjustment of the HV Default value.

5.1.3 Detector Code

Set the detector code according to the table in Volume 2, chapter 1.6, "Detector Codes".
5 Calibration

5.2 Calibration with Quick Start

This chapter describes the calibration in the Quick Start menu in detail. A quick reference guide can be found in chapter 4, on page 3-303.

The Quick Start menu allows one-point or two-point calibration with empty and full calibration.

The following reasons could make it necessary that you carry out the calibration on the main menu under Cal Parameters, rather than in Quick Start, e.g.:

- because during operation the container is under high gas pressure, this gas pressure, however, is not available for the calibration.
- because you want to enter the time constant and the limit value manually, and do not want to automatically calculate.
- because the limit value is to switch for bulk material at a specific bulk cone diameter.

We will advise you if you have any doubts as to the correct procedure.

If the Start menu is not already displayed, push HOME to go to the Start menu.

▶ Select Device Config ▶ Setup ▶ Quick Start.

QuickStart Menu

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Step 2</th>
<th>Step 3</th>
<th>Step 4</th>

<tbody>
<tr>
<td>Date Time</td>
<td>Nuclide Calibration Method Switch Function ReadIn Time</td>
<td>Measuring Path Product Density</td>
<td>ReadIn Background Lower Cal Pt-Empty Upper Cal Pt-Full Calibrate + Auto Set</td>
</tr>
</tbody>
</table>

This menu contains four steps (Step 1 to Step 4) with the corresponding submenus. Go through the individual steps menu item by menu item to configure your detector for all applications under standard conditions.
5.2.1  **Step 1**

- Enter the current date (**Date**) and time (**Time**). The Date is specified in the format MM/DD/YYYY, the Time in the format hh:mm:ss.

The correct date is important for the automatic decay compensation of the isotope. Since the activity of the source diminishes with time, the calibration count rates will be compensated automatically through the date. The decay compensation takes place daily at 09:01 h. Time differences have no impact on the correction of the decline in activity. However, the correct time is helpful to check the detector function: In case of error, you can see in the error log when the error occurred.

5.2.2  **Step 2**

**Nuclide**

- Enter here the isotope (nuclide) that is used in your source:
  - **Co-60**
  - **Cs-137**
  - **USER DEFINED**

This entry controls the automatic decay compensation. The correct entry is also important in a single-point calibration and for gas density compensation. The isotope used is listed on the type plate of the shielding and on your delivery documents. The item **USER DEFINED** allows you to use any isotope you want. In this case, additional parameters are requested: Specify the half-life under **Half Life Time** and the absorption coefficient at **Absorption**.

**What happens when you have selected the wrong isotope?**

Incorrect measurements as a result of the wrong decay compensation occur only after several weeks or months. If you also enter values for the product or gas density, incorrect switching thresholds will then be calculated (alarm thresholds for the level). With incorrect isotope selection for a one-point calibration, the calibration point for 100% will be calculated incorrectly.
Calibration Method

Here you specify the type of calibration. If you are in doubt about the appropriate method, see chapter 5.2. You can choose from the following calibration methods:

- **1-POINT**
  Use the 1-point calibration only if full calibration is not possible. This method requires an empty calibration (level below monitoring level). Using additional inputs such as product density and measuring path, the count rate for the full adjustment (level above the monitoring level) is then calculated automatically.

- **2-POINT**
  An empty calibration (level below the monitoring level) and a full calibration (level above the monitoring level) is required for a two-point calibration. Perform empty and full adjustment in Step 4.

Tip
Since the full calibration is actually measured and not only calculated, a better display accuracy will be achieved with this setting.

Switch Function

You can specify whether the limit switch is used as a High Alarm or as a Low Alarm. The switching direction affects the fail-safe function of the digital output (open collector). To get the warning messages, you have to evaluate the messages via the HART® signal or the digital output.

You have the following setting options:

- **MAX**
  The alarm is triggered when exceeding the switching threshold (alarm threshold for the level) (High Alarm).

- **MIN**
  The alarm is triggered when falling below the switching threshold (alarm threshold for the level) (Low Alarm).

- **MAX + BUILD UP**
  The alarm is triggered if the switching threshold is exceeded (High Alarm). In addition, monitoring is performed which triggers an alarm if wall deposits¹ (build-up) are detected. Prerequisite for correct function is that both the count rate for empty and the count rate for full was measured. During the measurement of the empty value it must be ensured that no build-up occurs. The settings for the build-up alarm are not defined in Quick Start; this is only possible via Device Config > Meas Parameter > Build Up Alarm (see chapter 2.44, page 3-288).

---

1. The function enables the early detection of wall deposits, i.e. before the reliable switching function is no longer guaranteed. The BUILD UP function, however, increases the time constant automatically and thus the reaction time.
ReadIn Time

Define here the period of time over which the count rate is to be read-in for each calibration point. The statistical variation of the count rate is averaged over this time period. The longer it is, the better the mean value. A time period of 60 s (default setting) is usually reasonable.

5.2.3 Step 3

This step is necessary only if you selected in Step 2 the setting 1-POINT as Calibration Method. Otherwise, continue with Step 4, page 3-311.

Measuring Path

Enter the measuring path of the beam path in the product that is to be measured in mm. Generally, this corresponds to the inner diameter of the container.

Product Density

For liquids, enter the liquid density, for bulk material, the bulk density of the product to be measured in kg/m³. If you known the liquid density and the bulk density only approximately, then you have to enter the lowest expected value.

5.2.4 Step 4

Start reading-in the count rates with ReadIn. While the count rate is read in, the average is calculated and displayed continuously. The duration of the reading-in process is defined under ReadIn Time (Quick Start ► Step 2 ► Setup).

When reading-in the count rates, the time remaining (Remaining Time) up to the end of the operation is displayed. Finally, you are prompted to confirm the detected count rate with OK. To shorten the read-in process, you can stop any time by pressing OK.

Under ReadIn you can read-in the following calibration points:

- BACKGROUND
- LOWER-PT
- UPPER-PT

Fig. 5-1 Measuring path in container

Product density and bulk density in kg/m³
ReadIn

Before calibration, you need to determine the count rate of the background radiation in order to correctly compensate for the decay of the radiation source. Before taking measurements, make sure you do not measure any radiation from the radiation source. For more information on the background radiation, see chapter 7.1, page 3-323.

- Under **ReadIn**, select **BACKGROUND**.
- Confirm with **OK** as soon as **Remaining Time** = 0s.

For detailed information about the background, see chapter 7.1.

For the next measurement, the level in the tank must be below the monitoring level or the tank must be completely empty. While you read-in, the level must not rise above the switching threshold and the conditions within the tank must match the conditions during operation as far as possible. If appropriate for your application and the beam path is affected, this concerns, for example, the gas density, a possibly existing stirrer or cooling/heating jacket (temperature, filling).

- Under **ReadIn**, select **LOWER-PT**.
- Confirm with **OK** as soon as **Remaining Time** = 0s.

The next measurement can only be performed at a 2-point calibration (**Step 2 ** Calibration Method: **2-POINT**). Otherwise, you can skip this step, the necessary data were then entered already in **Step 3**.

For the measurement, the level in the tank must be above the monitoring level or the tank must be completely filled. While you read-in, the level must not drop below the switching threshold and the conditions within the tank must match the conditions during operation as far as possible. If appropriate for your application and the beam path is affected, this concerns, for example, the gas density, a possibly existing stirrer or cooling/heating jacket (temperature, filling).

- Under **ReadIn**, select **UPPER-PT**.
- Confirm with **OK** as soon as **Remaining Time** = 0s.
Calibrate + Auto Set

With this menu item you enable the calibration data determined during the measurements. The calibration data are transferred to the parameter set Meas Parameter. Thus, the detector will get a new calibration which in the future will be used to determine the measured values. The optimum switching threshold and the time constant will be calculated automatically.

Please note that at Calibrate + Auto Set the following values will be set in addition:

- **Evaluation Mode = AUTO**
  (Time constant and limit value are determined automatically and updated continuously.)

- **Setup Gas Density = 0**
  (Gas density compensation is off.)

- **Op Gas Density = 0**
  (Gas density compensation is off.)

After the calibration, a status message is displayed, indicating if the activation of the calibration data has been carried out successfully. If not, the measurement parameters are unchanged.

Possible status messages are:

- **0-OK**
  The calibration carried out is OK.

- **1-ERROR BACKGROUND**
  The count rate of the background radiation is higher than that for the calibration points for empty or full (Lower Cal Pt-Empty or Upper Cal Pt-Full).

- **2-ERROR CALIBRATION POINT**
  The empty count rate is lower than the full count rate (Lower Cal Pt-Empty < Upper Cal Pt-Full).

- **3-ERROR THRESHOLD / TIME CONSTANT**
  The switching threshold (Threshold) is too close to one of the calibration points for empty (Lower Cal Pt-Empty) or full (Upper Cal Pt Full) or in the manual calibration, the time constant is too small. The error also occurs when the time constant exceeds 999 s.

- **4-ERROR THRESHOLD OUT OF RANGE**
  The switching threshold (Threshold) plus or minus the hysteresis exceeds the allowable range of 0% ... 100%.

- **5-ERROR BU TC**
  The time constant for the build-up alarm is above 14,400 seconds. This is either because the difference between empty count rate and full count rate is too low (Lower Cal Pt-Empty ≈ Upper Cal Pt-Full) or the limit value is too close to one of the calibration points for empty (Lower Cal Pt-Empty) or full (Upper Cal Pt-Full).

- **6-DATE ERROR**
  A date is still set to the default value of 1.1.2000. At Calibrate, check the Date parameter. At Restore, check the date in Restore Date.
7-CHECK ERROR

The status of the calibration parameters could not be fully verified. In this case, repeat the calibration. If the error occurs again, replace the detector, at least the detector electronics.

If an error has occurred, please try to eliminate the cause and perform a re-calibration. Under Meas Parameter in the Start menu, you can verify that the calibration values after calibration are correctly incorporated in the measurement parameters.

► At the end, fill out the commissioning log, see chapter 9, page 3-347.

Tip
Always carry out a test calculation after every calibration. This will ensure that your calibration data are plausible and the detector is set correctly (see chapter 2.35, page 3-280, Cps Average Mode and Cps Average Test).

This completes the calibration.

Advanced functions

In addition to calibration with Quick Start, you can also calibrate using the Cal Parameter menu. Further options are offer there, such as:

- Manual setting of limit value and time constant
- Calibration with gas density compensation

You can enable additional signals and messages in the menu Signal Condition.

Via I/O Setup you can use existing or optional I/Os to output or process signals.

In order to avoid the risk that the device supplies faulty signals, it is imperative that you familiarize yourself with these additional features before you use them.
5.3 Ensuring the Function of the Measurement

Please proceed as follows to ensure that the measurement is working correctly after calibration or parameter change:

- Check the live display
- Compare the measured values with the control system
- Simulate measured values with test generator
- Perform test run with product
- Archive the calibration data

5.3.1 Simulating Measured Values with a Test Generator

The measuring system has an internal test generator to generate counts that can be used to check the calibration and thus the measured value display accurately.

For this purpose the counting rates of the calibration values may be used.

- Select Device Config ➤ Setup ➤ Service ➤ Test ➤ Test Settings.
- Set Cps Average Mode to FIXED VALUE.
- Enter the calibration count rate for Cps Average Test.
- Read off the expected measured value at Level or Density.

In addition to the calibration count rates, you may also enter intermediate values, if necessary, to check the measured value display.

At the same time, you can also compare the measured value display in the control system for every single count rate with the measured value displayed in the LB 480 to ensure the correct transfer of the measurement signal.

After this simulation has been completed, you have to switch the parameter Cps Average Mode back to NORMAL. If you forget this, the measurement remains frozen. As a reminder, the Communicator cyclically outputs error message 106 and the Operating Status of the measurement shows TEST (instead of RUN).
5.3.2 Checking the Live Display

Check the live display to make sure no error is displayed and the measurement is in the normal measurement mode. You can also see whether the measured values are plausible and are output correctly.

- Select Live Display.
  - The Operating Mode must show RUN.
  - At Level or Density, the current target value must be displayed and must be alive *
  - At Current OUT, the current target value must be displayed and must be alive *

*) Alive = the display must fluctuate around a mean

5.3.3 Test Run with Product

This test will give you the highest level of security, as it is performed under real conditions. The test should be performed under operating conditions, if possible; i.e. any existing stirrer should run and a gas pressure existing during operation should also be present during the test. However, often this involves a lot of effort, so that the options on site and the need have to be clarified first. In many cases, water rather than product may be used for a test run and a possible gas pressure can often be simulated with nitrogen. The differing density between the product and the substitute product used for the test has to be taken into account.

**Level**

- Fill the container. Move the container under operating conditions from empty to full.
- Record the measurement signal and verify this.

Substitute procedures such as closing the source when the container is empty can be used only to a limited extent as a functional test.

If substitute procedures are chosen, the restrictive conditions must be carefully evaluated.

**Limit switch**

- Control the limit level under operating conditions.
- Record the response of the measurement and verify it.

Substitute procedures such as closing the source when the container is empty can be used only to a limited extent as a functional test.

If substitute procedures are chosen, the restrictive conditions must be carefully evaluated.
Density measurement

A density measurement is best tested using sample values. To this end, samples distributed over the measuring range should be taken and these should be compared with the display value.

If the measuring area also covers the density of 1g/cm³, then water may also be used for the test. If it is not possible to control different densities within the measuring range, a one-point calibration can alternatively be performed. Since only one point within the measuring range is tested, it must be clarified whether this test is sufficient for the application.

If in doubt, please ask the BERTHOLD TECHNOLOGIES Service for support.

5.3.4 Archiving Calibration Data

We generally recommend to archive both the calibration and all other settings. This greatly simplifies and accelerates any necessary exchange of the measuring system. Also, incorrect operation may cause data loss and in this case archived data may be very helpful.

There are several ways to archive data.

- Fill out the parameter protocol in the Appendix to the operating instructions
- Digital storage of data

Several options are available for digital storage, depending on the communication interface and host used:

- LB 480-PC (Berthold specific program for the RS485 interface)
- HART® Communicator
- Siemens Simatic PDM
- AMS Emerson Process

See also Volume 3, chapter 1.5, "Archiving Parameter Sets".
6 Functional Processes

The following chapter describes the major functional processes that occur when working with the SENSseries.

6.1 Plateau Measurement

Below we will describe how to perform a plateau measurement. The plateau measurement checks the function of the detector.

**IMPORTANT**
The radiation conditions must be constant while recording the plateau!

![Plateau Measurement Diagram](image)

*Fig. 6-1 Result of a plateau measurement*

The plateau is the flat section of the curve and it is typically approx. 200V long (see also Volume 2, chapter 4.5). Please note that the above characteristic curve and the following information is only valid for a NaI detector. With a plastic scintillator the plateau is steeper and may have to be qualified by a BERTHOLD service technician.

The crystal-multiplier assembly or the complete detector has to be replaced if:

- the plateau is shorter than 50V
- the count rate changes by more than 5% per 100 Volt high voltage

**IMPORTANT**
During the plateau measurement the level measurement is held at the last measured value.
If the Start menu is not already displayed, push ➤HOME to go to the Start menu.

► Select ➤Device Config ➤Setup ➤Service ➤Plateau ➤Plateau Measurement.

► At HV Start enter the high voltage (e.g. 500V, minimal 300V), where the plateau measurement should start and confirm the input with ENTER.

► At HV Stop enter the high voltage (e.g. 1000V, minimal 1300V), where the plateau measurement should stop and confirm the input with ENTER.

► At HV Step enter the step size between the measurement points (e.g. 50V) and confirm by pressing ENTER.

The step width determines the number of value pairs. The larger the step width, the lower the number of the value pairs!

► At Meas. Time enter the time how long a measurement point should be recorded or the count rate is to be averaged (e.g. 20 s) and confirm the entry with ENTER.

► Transfer the entries with SEND.

► Select PLATEAU at HV Mode to start the plateau measurement.

The plateau measurement is started. For this purpose, the measuring mode is exited and the plateau of the multiplier which is used in the detector is measured.

During the plateau measurement the values of the following parameters are updated continuously:

• HV Live: HV value of the voltage at which the count rate is being measured.

• Cps Live: Count rate.

At the end of the plateau measurement the detector automatically switches back to HV Mode: AUTO or MANUAL, depending on which mode was last set.

The plateau measurement is now complete and can be viewed and reviewed under Plateau View as a table or plateau curve.
6.2 Master Reset

Besides the options described in Device Config ▶ Setup ▶ Service ▶ Reset Device on page 3-278 to reset the detector or certain functions, there is the Master Reset, which deletes all parameters. You have to open the housing to perform the Master Reset.

⚠️ IMPORTANT

Perform a Master Reset only if a previous SW Reset or even a Factory Reset was not successful.

Please keep in mind that after a Master Reset:
- the previously set parameters will be lost
- the license key must be entered again
- current output and HV default have to be adjusted
- the measurement needs to be calibrated

If in doubt, have this work carried out by the BERTHOLD TECHNOLOGIES service.

⚠️ WARNING

Risk of explosion!

For detectors that are used in hazardous areas, the housing must only be replaced by the BERTHOLD TECHNOLOGIES service or by persons authorized by BERTHOLD TECHNOLOGIES. If this is not possible, you must replace the entire detector or return it to the manufacturer for repair.

For non-Ex devices, you can proceed as described below.

Preparing for Master Reset

You will need:
- M5 and M8 Allen wrenches to open the housing.
- Jumpers to bridge two pins.
- Your original license key from your code listing or from the Service menu.
- Multimeter to adjust the current output.
- Detector code for HV adjustment
- The current value for HV Default (chapter 2.14, page 3-247).
- Clean working environment, so that no debris or dirt can get into the electronics.
Risk of fatal injury due to electric shock!

If the housing is open you may come into contact with live parts if the power supply is connected.

The Master Reset has to be carried out with open housing cover and the power supply turned on. Power supply is applied to the terminals 1 to 4.

Furthermore, high voltage is present in the area of the base of the board for the photomultiplier.

**Perform Master Reset**

1. Disconnect detector from mains.
2. Open housing.
3. Plug bridge on connector "F" (the connector is located on the CPU board next to the large capacitor).
4. Turn detector on and wait 10 seconds.
5. Turn detector off again.
6. Pull bridge off connector "F".
7. Turn detector on and wait 10 seconds.
8. Turn detector off again.
9. Connect HART® Communicator to the current output in the terminal compartment.
10. Turn detector on again and wait 10 seconds.
11. Acknowledge error message on HART® Communicator.
12. Enter License Key new, menu **Device Config** ► **Setup** ► **Service** ► **License Key**.
13. Adjust current output with multimeter, menu **Device Config** ► **Setup** ► **I/O Setup** ► **Current Out** ► **D/A trim**, see page 2-151.

**IMPORTANT**
The adjustment is absolutely essential, even if the current output appears to be OK.

14. Enable monitoring of the 4-20 mA current signal (set to **ENABLED**), menu **Device Config** ► **Setup** ► **I/O Setup** ► **Current Out** ► **Current Loop Monitoring**.
15. Set **Detector Code**, menu **Device Config** ► **Setup** ► **Sensor Configuration** ► **Sensor Settings** ► **Detector Code**, see page 2-151.
16. Set **HV Default** (see chapter 5.1.2).

This completes the reset, the detector is now ready for calibration.
Explanations

7.1 Background

The term "background" refers to the count rate resulting from the natural environmental radiation. The background level is largely dependent on the scintillator volume. The background is not accounted for by the decay compensation as it is regarded as a constant.

An error when recording the background may later lead to drift effects in the measurement. Influences from neighboring radiation sources must be avoided.

The background has to be recorded only for SuperSENS. The background need not be recorded for the CrystalSENS.

Below we will present three options for measuring the background. The best approach for your background measurement is dependent on the situation on site and on the type of radiation source.

**Best solution**

With empty (Fig. 7-1 left) or full (Fig. 7-1 right) tank and mounted detector, but without the shielding or without the source installed in the shielding.

**IMPORTANT**

*The detector must not receive any radiation from the radiation shielding which has been put on the side and is closed. To this end, the shielding with the source has to be put in an adequate distance (approx. 15 m), or behind a thick concrete wall.*

![Fig. 7-1 Best solution](image-url)
Second best solution

With a full container, mounted detector and attached shielding and with the radiation sources installed and closed source exit channel.

Third best solution

This procedure is recommended only for Cs-137 sources.

With an empty tank, mounted detector and attached shielding and built-in radiation sources and closed source exit channel. In this way, the detector usually receives a small amount of residual radiation from the source.
7.2 Conditions for Empty Calibration

**IMPORTANT**
Empty calibration, particularly for high-pressure containers, must be conducted under the same conditions as operation (pressure, temperature).

- For empty calibration, all shielded containers of the measuring system must be mounted.
- The source shutter must be open.
- The tank should be empty or be filled below the limit value.

**Wall deposits**

The container must be empty and clean without any residues. If deposits gather along the walls during operation, empty calibration should be conducted periodically.

**IMPORTANT**
For wall deposits a measurement system with a Co-60 source is less sensitive than one with a Cs-137 source.

**Agitator**

- The agitator must be in operation if it has any impact on the measurement.
High gas pressure

- If the container is under high gas pressure during operation, the empty calibration also has to be carried out under this gas pressure. If this is not possible, then the empty calibration can be done without gas pressure and the count rate can be compensated using the corresponding entries for gas density and measuring path.

Cooling and heating jackets

- Cooling and heating jackets must be filled for calibration. In order to get the density of the cooling/heating fluid, it should be at the same temperature as during operation.
7.3 Bulk cone measurement

With bulk material, the monitoring level (switching threshold or alarm thresholds for the level) is determined on a defined diameter of the bulk cone. For the measurement to work well, the count rate at the switching point must clearly differ from the count rate at full and empty tank.

Provided that the design was calculated by BERTHOLD TECHNOLOGIES, this is already accounted for. The measuring system must be installed at the location where the bulk cone diameter is to be monitored.

- Set Evaluation Mode to **AUTO SET**, see page 3-287.
- Set Cal Method to **1-POINT** or **2-POINT**, see page 3-287.
- Determine the count rates for empty (**1-POINT**), or for empty and full (**2-POINT**).
- At Product Conditions type in the product density (**Product Density**) and the diameter of the bulk cone (**Bulk Cone Diameter**), where switching should be effected, see page 3-267.
- Complete the process with Calibrate, see page 3-257.

The switching point and the time constant at Calibrate are automatically recalculated.

Then the detector is ready for operation again.
7.4 Radiation Interference Detection

Fig. 7-4 Radiation interference

7.4.1 Detecting Interference Radiation

The high Gamma sensitivity of scintillation detectors may cause a false reading. To detect interfering radiation, a double plausibility check can be enabled.

The alarm is triggered by:

Maximum possible count rate (empty calibration)

\[ I_s > I_o \times 1.5 \]

\( I_s \) = current count rate in cps integrated over one second
\( I_o \) = maximum count rate at empty calibration

A relative limit value is monitored, i.e. the alarm threshold is reached when exceeding a maximum dose rate (calibration value at empty vessel) at the detector.

False alarms due to operative factors are not possible. However, only stronger interfering radiation is detected.
7.4.2 Interference Radiation Detection Flow Chart

If radiation interference is detected, following will happen:

If interference radiation is detected, the measurement switches to the HALT mode.

- Measured value and current output are "held".
- Error relay indicates alarm.

The measurement is "held" up to the end of the defined waiting time.

At the end of the waiting time the system checks if the arriving count rate is smaller than 1.5-times the calibrated empty count rate ($I_o$) (see scenario A). If not, the waiting time starts again.
7.5 Time constant

The time constant is calculated automatically (factory setting), but can also be manually set to a fixed value. The time constant smoothes the output signal. Statistical fluctuations, as well as level fluctuations due to the process, e.g. by agitators, are smoothed.

The measured data supplied by the detector is averaged with the time constant.

A so-called RC-averaging is carried out:

\[ nM = aM + ((AZR - aM) \times (1 - e^{-t/\tau})) \]

where:
- \( nM \) = new mean value
- \( aM \) = old mean value
- \( AZR \) = current, non-averaged count rate (current display count rate)
- \( t \) = time interval between the measurements in seconds
- \( \tau \) = time constant in seconds

Fig. 7-5 shows the reaction of the output signal in case of erratic filling of the container (input change) from 0 to 100%.

![Fig. 7-5 Time constant](image-url)
7.6 Software Versions

Two programs are needed to operate the SENSseries:

- **Embedded Software**: It is stored in the SENSseries (hardware).
- **Device Description (DD)**: It is stored on the HART® Communicator.

To ensure that operation works smoothly, the DD version has to correspond to the embedded software on the SENSseries.

Proceed as follows to find the revision of the Device Description (DD) LB 480. The Device Description is the user interface the HART® Communicator requires to operate the respective device, e.g. the SENSseries LB 480. Each device requires its own DD.

7.6.1 Software Management

**Show software versions**

If the Start menu is not displayed, push **HOME** to go to the Start menu.

- Exit the Start menu by selecting the button "to the left".
- Select **UTILITY**.
- Select **SIMULATION**.
- Select **BERTHOLD TECHNOLOGIES**.
- Select LB 480.

Here you can read the revision of the Device Revision (Dev vX) and the Device Description (DD vX).

**Type of modifications**

HART® distinguishes two different types of software modifications:

- Modifications affecting functions and thus the DD and the embedded software.
  
  This type of modification will affect the compatibility to previous software versions.

- Modifications which only affect the DD or only the embedded software.
  
  These modifications do not affect the compatibility to the previous software version.
Example:

If a new function is added which allows you to enable or disable the digital input of the SENSseries then the embedded software has to be changed.

Likewise, a selection option has to be provided in the DD. Since this function was not yet implemented in previous versions, this will lead to incompatibilities with older software versions.

Two version numbers each

HART® has therefore introduced a system for identification which, at the same time, also describes the compatibility of the DD with the embedded software. Therefore, there are two HART®-specific version numbers for each software modification.

- A number that is incremented for each modification:
  - Software rev for the embedded software
  - DD v for the Device Description
- A number that is incremented only if compatibility with the previous software is no longer given:
  - Fld dev rev for the embedded software
  - Dev v for the Device Description

The table below shows the software versions of the SENSseries LB 480 for the version with HART® Communicator:

<table>
<thead>
<tr>
<th>Embedded software version in the SENSseries</th>
<th>Device Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Software versions (indicated on the HART® Communicator)</td>
</tr>
<tr>
<td></td>
<td>Software rev</td>
</tr>
<tr>
<td>Software version</td>
<td></td>
</tr>
<tr>
<td>1.00.00</td>
<td>1</td>
</tr>
<tr>
<td>1.00.01</td>
<td>2</td>
</tr>
<tr>
<td>1.00.02</td>
<td>3</td>
</tr>
<tr>
<td>1.00.03</td>
<td>4</td>
</tr>
<tr>
<td>1.00.04</td>
<td>5</td>
</tr>
</tbody>
</table>
Explanations

Software release in the SENSseries (embedded software)

The software release of the embedded software in the SENSseries is described by the following three identifications:

- **Software version**: Berthold internal version number, e.g. 1.20.01
  - It is needed when the embedded software of the SENSseries is to be updated.
- **Software rev**: ongoing revision number, e.g. 12
  - It is incremented with each embedded software modification.
  - Display of the **Software rev** see page 3-331.
- **Fld dev rev**: Field Device Revision, e.g. 3
  - This number will be incremented only when new commands have been implemented which create an incompatibility to previous DD versions.
  - It is stored in the embedded software of the SENSseries.
  - It shows which DD is required to utilize the full range of functions.
  - It is checked for compatibility by the DD (Dev v).
  - Display of the **Fld dev rev**, see page 3-331.

Software release of the DD (Device Description)

The software release of the DD on the HART® Communicator is identified by two version numbers:

- **Dev v**: Device Version, e.g. 3
  - Revision number of the DD on the Communicator.
  - It is incremented only for modifications where new commands have been implemented that create an incompatibility with previous versions.
  - It is checked for compatibility with the **Field Device Revision** (see above).
  - Display of the **Dev v** see page 3-331.
- **DD v**: DD Version, e.g. 3
  - Consecutive number of the DD on the Communicator.
  - It is incremented for any DD modification.
  - If may be higher than the **Dev v**.
  - Display of the **DD v**, see page 3-331.

Compatibility

You can load several different revisions onto the HART® Communicator. The Communicator compares the **Field Device Revision** of the SENSseries with the **Device Version** of the DD. The compatible DD version is started automatically.
What to do if ...

If no suitable DD is available on the HART® Communicator, then one of the following two things may happen:

**Scenario 1:**

The DD on the Communicator is older than the version of the embedded software in the SENSseries.

Example:

DD on the Communicator: **Dev v1**  
Field Device Revision: **Fld dev rev: 2**

The following warning is displayed on the Communicator:

This means the DD has to be updated to utilize the full functionality of the detector.

Then follows the question: **Continue with old description? Yes/No**

▶ Select **Yes**.

You can continue working normally with the detectors. Only new functions that do not yet support the DD are not available.

**Scenario 2:**

The DD on the HART® Communicator is more up-to-date than the version of the embedded software in the SENSseries:

Example:

DD on the Communicator: **Dev v2**  
Field Device Revision: **Fld dev rev: 1**

Then the **Generic DD** starts. HART® does not allow that in this case an existing DD by the manufacturer will be loaded, otherwise the program on the Communicator may crash. In the Generic DD you cannot calibrate and many parameters for the SENSseries are missing.

**Universal Revision**

All Berthold-DD’s require the Universal Commands for HART® 6 or higher.

This requires that the HART® Communicator by Emerson Process, Model 375/475 is used.

Other HART® compatible communicators with HART® 6 may also be used, provided they support Enhancements.

If the Communicator has a lower version than HART® 6, then the **Generic DD** will be started.

To determine the version of the Universal Commands, call on the HART® Communicator the menu **Device Config > Setup > Identifications > Device Revision > Universal Rev.**
Error Handling

Errors are indicated by the digital output and/or via fault current. Error messages are displayed on the HART® Communicator. All error messages are stored in the error log together with date and time. To view the error log, select Device Config ▶ Diagnostic ▶ Log ▶ Error Log.

8.1 Error Handling Modes

The behavior in case of errors is dependent on the weighting set in Error Handling (Device Config ▶ Setup ▶ Signal Condition ▶ Signal Parameter, chapter 2.16, page 3-251): NORMAL or SENSITIVE.

Both operation modes behave as follows:

- **SENSITIVE**
  
  All faults cause the current output to report a Fault current. To also get warning messages, you must also evaluate the messages via the HART® signal or the digital output.

  The setting SENSITIVE is automatically enabled when the Safety Mode is selected.

- **NORMAL**
  
  Only fatal errors are reported as a fault current. Thus, the measured value via the current signal will fail only if the measurement can no longer be used.

  To also get minor error and warning messages, you must also evaluate the messages via the HART® signal or the digital output.

**IMPORTANT**

You may select the NORMAL setting only if hazards to persons or damage to property as a result of a faulty measured value can be ruled out.

Select SENSITIVE if system safety is an important issue. Use NORMAL if a failure of the measurement is non-critical for human health and the environment and production safety is an important issue.

To use the digital output for the above mentioned messages, you need to use the setting WARNING + ERROR on the menu Digital Out Function (Device Config ▶ Setup ▶ I/O Setup ▶ Digital Output ▶ Digital Out Function, see chapter 2.27, page 3-273).
### 8.2 Device Response to Errors

The following tables provide a description of the error codes, error and warning messages, information about the reason for the error and how to remedy the error. To keep the list clearer, we have created two separate lists for **SENSITIVE** and **NORMAL**.

The list is so detailed as to cover and diagnose all possible error sources in such a radiometric measuring system. Thus, it is possible to offer the user a high level of safety and diagnostic options.

**Meaning of the individual columns:**

<table>
<thead>
<tr>
<th>Identification</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>x</td>
<td>An error message is issued.</td>
</tr>
<tr>
<td>–</td>
<td>No error message is output.</td>
</tr>
<tr>
<td><strong>Error Log</strong></td>
<td>The error that occurred is written to the error log.</td>
</tr>
<tr>
<td><strong>HART®</strong></td>
<td>An error telegram is digitally output via the HART® to the process control system. The control system must evaluate the HART® signal.</td>
</tr>
<tr>
<td><strong>Digital Out</strong></td>
<td>The digital output of the detector is actuated. In the standard version, this is an open collector; a relay output is also possible.</td>
</tr>
<tr>
<td><strong>Fault current</strong></td>
<td>The current output switches to fault current. The 4-20 mA measurement signal is no longer available. The measurement signal is then available only via the digital HART® protocol.</td>
</tr>
<tr>
<td><strong>SHUTDOWN</strong></td>
<td>The current output switches to fault current, the HV (high voltage on the photomultiplier) goes to 0V. The measurement stops and can only be restarted by a restart of the detector or a software reset after the problem is solved.</td>
</tr>
<tr>
<td><strong>Self-repairing</strong></td>
<td>If the error disappears, then the fault condition is removed automatically. If the error is not self-repairing, then you need to reset the error state by rebooting or software reset.</td>
</tr>
<tr>
<td><strong>Quality of measurement value for Master and Slave (only HART®)</strong></td>
<td></td>
</tr>
<tr>
<td>g</td>
<td>Measured value is good</td>
</tr>
<tr>
<td>u</td>
<td>Measured value is uncertain</td>
</tr>
<tr>
<td>f</td>
<td>Measured value is frozen</td>
</tr>
<tr>
<td>b</td>
<td>Measured value is bad</td>
</tr>
</tbody>
</table>

---

1. The digital HART® protocol conveys the measured value as well as its quality.

<tr>
<td>Current output at 24mA</td>
<td>Current output faulty or defective.</td>
<td>Recalibrate current output. Then restart detector by Software Reset or by turning the power supply off/on. If the current output cannot be calibrated, the detector needs to be repaired.</td>
</tr>
</tbody>
</table>
8.4 Reset

The SENSseries detectors can be reset in various ways. Use the menu Device Config ➤ Setup ➤ Service to perform a software reset or reset all settings to factory default.

1. Software reset: **SW RESET**
   - Starts the new detector, the parameters remain unchanged.
   - The function corresponds to the switching off and on of the supply voltage.

2. Factory reset: **FACTORY RESET**
   - Resets most settings to factory default. Some settings, such as the adjustment of current output and the license key will be preserved. Turn the HART® Communicator off and on again after you have initiated the reset.

Switching the supply voltage off/on also causes a reset similar to the software reset, but in this case possible "hardware blocks" will also be fixed. The parameters remain unchanged.

See also chapter 6.2, "Master Reset", page 3-321.

8.5 Operation Modes during Measurement

Select Operating Mode (menu Live Display, page 3-236) to view the current operating status.

8.6 Error Reset

If an error or a warning is identified, an error message is displayed. This error message must be reset. If the error still occurs after resetting, it will be indicated again on the display.

If the error is corrected, but the error message is still displayed, the error can be acknowledged as follows:

1. with **Acknowledge Error** under Diagnostic ➤ Operating Status
2. with a **Software Reset** under Device Config ➤ Setup ➤ Service ➤ Reset Device
3. by switching the supply voltage off and on.
8.7 Fault Current

There are four different ways of how the current output should respond to errors:

- **High**: Hold at >21mA.
- **Low**: Hold at >3.6mA.
- **Hold**: Hold last measured value.
- **Value**: Hold at a selected value between 2 and 22mA. The corresponding value must be defined in Error Current Value (see page 3-271).

**Example for High**

![Example for High](image1.png)

**Example for Hold**

![Example for Hold](image2.png)
Setup Protocol

For reasons of clarity, only those parameters are listed in the following list which have a decisive influence on the measured signal.

As an alternative to completing the list below, you can also transfer and print the data digitally, via the HART® signal. See also chapter 1.5, "Archiving Parameter Sets", page 3-225.

- After commissioning, enter the parameters in the following parameter list in order to document the start-up.

<table>
<thead>
<tr>
<th>TAG No.</th>
